May 2026 Release (R45)

See what's new in the May 2026 Release (R45).

Welcome to the May 2026 Release (R45)!

Coupa release notes provide important information about the latest version of the software, including descriptions of new features and other updates in the release.

Getting Started

Start here to learn about the May 2026 Release (R45), the release schedule, supported browsers, and more.

New to the May 2026 Release (R45)?

Start here to understand how to use the release notes to make sure you are ready for the upgrade. Read the following topics in the About Coupa Releases section of the Coupa Documentation portal:

- [How to Use Release Notes](#)
- [How to Get Ready for Release Updates](#)

Release Documentation Schedule

Find the important dates for the May 2026 Release (R45) documentation updates.

Important dates

Find below the schedule for the May 2026 Release (R45) documentation updates. The first set of release notes is published early to provide a preview of coming features, and an update is provided at the time of the release deployment to sandboxes.

Date	Action
March 30, 2026	• May 2026 Release (R45) announced to all customers and partners. • Release Notes v1 available for customers and partners with PDF. This version of the release notes focuses on feature descriptions so that you can understand what's new and changed, and why.
April 27, 2026	• Release Notes v2 available for customers and partners with PDF. • Finalized information that integrates with feedback from our professional services and support teams.

For more information, see [Upcoming Coupa Release Schedule](#).

Supported Browsers and Email Clients

See the browsers and email clients supported in the May 2026 Release (R45).

The May 2026 Release (R45) supports the latest versions of the following web browsers:

- Google Chrome
- Mozilla Firefox
- Microsoft Edge

The May 2026 Release (R45) supports the latest versions of the following email clients:

- Apple Mail
- Google Gmail
- Microsoft Outlook
- Yahoo Mail 7.58.0

Additional Formats

Access the release notes and feature list in the PDF and Excel formats.

If you prefer, you can get a PDF version of the release notes and the Feature Impact List as an Excel file, but remember to check this site for the most recent information.

☆ IMPORTANT:

The release notes PDF and the feature impact list Excel file are kept updated until the release is deployed to production. Once the release maintenance phase begins, these files are no longer updated. Always check Compass for the most accurate and up-to-date information.

Release notes PDF file

Date	Description	Document Version
March 30, 2026	First customer release	May 2026 Release (R45) Release Notes v1.0.pdf
April 27, 2026	Final customer release	Not yet published

Feature Impact List (FIL) Excel file

Date	Description	Document Version
March 30, 2026	First customer release	Not yet published
April 27, 2026	Final customer release	Not yet published

Additional Resources

Access more sources of information about the May 2026 Release (R45).

Learn more about the May 2026 Release (R45) with the following resources:

- For information about when we are planning to release new Coupa versions to sandboxes and production, see the [Upcoming Coupa Release Schedule](#).
- For information about significant terminology updates and improvements in other languages, see [Translation Notes](#).

What's New in This Release

See the new features and other updates included in the May 2026 Release (R45).

R45 Feature Impact List

The R45 Feature Impact List includes details to help you assess the new features in the May 2026 Release (R45).

Use this list of all the new features to assess the upgrade impact of the May 2026 Release (R45). This should be the first stop in your upgrade planning.

You can also download the Excel version of the Feature Impact List.

How to use the Feature Impact List

Section	Description
Feature	Basic title or name of the new feature or enhancement with a link to the release note.
Description	Basic details about what has changed since the previous release.
On	Indicates if the feature or enhancement is on by default. • If No, then you should expect no changes to your user workflows or the product's user interface. • If Yes, then you should make sure you understand what has changed and why, and if you need to update your user training to accommodate the changes.
Perm (Permissions)	Indicates if there are changes to roles or permissions.

Section	Description
	• If No, then the feature or enhancement didn't introduce new permissions or modify existing roles. • If Yes, then you should check the topic and the <i>Roles and permissions</i> section to understand the changes to the system roles and the possible migrations for your custom roles.
Integ (Integrations)	Indicates if there are changes to either the API or flat file (CSV) integrations. • If No, then the feature or enhancement didn't change the API or CSV. However, this doesn't mean that there weren't changes to an object's table. • If Yes, then you should check the topic and the <i>Integrations</i> section to learn what has changed, and if it affects your integrations.
Change Since March 30, 2026	Indicates if the feature or enhancement has been added, removed, updated, or if it has not changed (N/A) since March 30, 2026.

Procure

Coupa Procurement

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
Demand Aggregation for Scheduled Issuance	Apply aggregation rules to requisition lines that share common attributes, and reduce the number of POs sent to suppliers.	Yes	No	No	N/A
Enhanced Item Details and Supplier Selection	Make more informed purchase decisions about products you search, with item details presented more clearly, making it easier to distinguish between multiple	No	No	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
	supplier items, on an updated interface.				
Enhanced Item Management	Create and manage items through a more intuitive, tabbed interface that separates core item information from supplier-specific details to better guide you, and help you track your progress when creating an item, without the long scrolling previously needed to	Yes	No	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
	add all item details on one page.				
Level 2 Punchout Support	Manage the visibility of specific punchout items in Coupa search using hosted catalog tools to guide user purchases in Coupa while directing buyers to supplier stores for real-time pricing and availability.	No	No	No	N/A
More Precise Control Over Item Access	Gain greater control over who can manage non-catalog items, by	Yes	Yes	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
	assigning separate permissions for editing core item information versus editing supplier-specific details, including sensitive fields around pricing and contracts.				
Updated Catalog Approval Conditions	Make catalog item approvals more efficient and compliant by setting new conditions to separate the approvals of core item information from suppli-	Yes	No	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
	er-specific details.				

Services Procurement

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
Services Procurement Approvals Enhancements	Use dynamic approval roles to route services transactions to the correct managers automatically, with additional enhancements for creating more precise services procurement workflows.	Yes	No	No	N/A
Simpler	Manage	Yes	Yes	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
Configuration for Services Procurement	more Services Procurement settings through the user interface, including a new Services Procurement setup page to improve visibility and control over your system behavior.				
Job Roles and Rates on Service Request Forms	Simplify intake and enforce compliance for recurring services, by predefining job roles and rates on request forms.	Yes	No	No	N/A
Preserve Item Pur-	The Item (Amount)	No	Yes	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
chasing with Services Procurement	line type is now available for fixed-price, non-services requisitions, even with Services Procurement enabled.				
Sourcing for Service Workers	Find contingent workers to fill the job roles you need by using Coupa Sourcing to solicit and evaluate bids from a range of staffing firms, rather than relying on external systems or manual	Yes	No	Yes	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
	tracking.				
Worker Assignment Approvals	Ensure that key stakeholders review and approve assignment details, such as dates, locations, worker qualifications, and onboarding requirements, giving you more control over service workers and assignments.	Yes	Yes	No	N/A
Other Services Procurement Enhancements	See the Guided Buying Agent, defaulting of contract rates, and	Yes	No	No	N/A

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
	pre-seeded worker processes displaying by default for Services Procurement customers only.				

Coupa Inventory

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
Supplier Visibility for ASN cXML Errors	Suppliers can track cXML Advance Ship Notices (ASNs) stuck in transmission.	Yes	Yes	No	N/A

Intake and Orchestration

Coupa Smart Intake and Orchestration

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
Account Widget in Smart Intake Forms	Collect accounting information directly from requesters to ensure requisitions are finance-ready and reduce manual intervention.	Yes	No	No	N/A
Field Option Rules in Smart Intake Forms	Control which fields options and choices requesters see on forms.	Yes	No	No	N/A

Invoice

Invoicing

Feature	Description	On	Perm	Integ	Change Since March 30, 2026
Support for Brazil Tax Reform	Capture and validate new tax types, including CBS, IBS, and IS, through the user interface (UI), CSV, or API to comply with the Brazilian tax reform.	Yes	No	Yes	N/A

Coupa Procurement

See the features added to Coupa Procurement for the May 2026 Release (R45).

Demand Aggregation for Scheduled PO Issuance

Apply aggregation rules to requisition lines that share common attributes, and reduce the number of purchase orders (POs) sent to suppliers.

Demand aggregation groups approved requisition lines from different requisitions based on matching attributes such as supplier, site, or item, defined in aggregation rules. Demand Aggregation is available at both the header and line levels on the **Requisitions Details** page by selecting **Schedule and Aggregate**.

Use **Schedule and Aggregate** to schedule lines, schedule dates, define interval dates, and to apply aggregation rules. You can also **Unschedule** lines from the dropdown menu.

For scheduled lines which do not have aggregation rules applied, the behavior follows standard schedule issuance rules. You need the **Schedule PO Issuance** permission available in the standard **Buyer** roles to use Demand Aggregation.

For more information, see [Use Scheduled Issuance to Control PO Timing](#).

Enhanced Item Details and Supplier Selection

Make more informed purchase decisions about products you search, with item details presented more clearly, making it easier to distinguish between multiple supplier items, on an updated interface.

When you select a hosted item in search results to view more information, you're now taken to a redesigned page showing more product details on a cleaner, modern layout. Enhanced item details pages provide more general data about an item, as well as additional supplier-specific attributes, helping buyers make more informed purchasing decisions.

The **Supplied By** menu now appears higher in the page where it's easier to browse different suppliers for an item and quickly see how pricing, part numbers, and other details vary by supplier, as well as which hosted supplier items are preferred by your organization.

As you type a supplier or contract name in the new searchable, type-ahead, **Supplied By** field, matching suppliers display with their pricing, contract name (where applicable) and whether a particular supplier's item is considered preferred by your organization. Admins who want to retain the previous behavior, where only the supplier name displays here, can uncheck a new setting under **Setup**→**Company Setup**→**Company Information**→**Enable additional details on supplier dropdown**.

When users search an item, the **Supplied By** field also displays in the search panel, as well as on each item within a search results page.

Other improvements to the item detail page include:

- **Enhanced Item Status:** Specific item states, such as backordered or out-of-stock items, are highlighted more clearly with color-coded icons and formatting.
- **More prominent image:** Multiple images can be added, and the images depicting the item are more visible, displaying in the top-right area of the page.
- **Collapsible Sections:** To help you focus on relevant data, all sections except the main item details are collapsed by default.
- **Responsive Design:** The page layout automatically adjusts for smaller screen widths to maintain readability.

For more information, see [Coupa Search](#).

Enhanced Item Management

Create and manage items through a more intuitive, tabbed interface that separates core item information from supplier-specific details to better guide you, and help you track your progress when creating an item, without the long scrolling previously needed to add all item details on one page.

Now you can add and manage items through a simpler, guided process on a modern user interface. When creating or editing items (including within a catalog) a new interface separates the process into two stages:

- **Item Details:** Enter the item name, description, and core details (sometimes called “parent item” information) such as item type, unit of measure (UOM), and manufacturer information, allowing you to create the item with the minimum required information. Non-required fields, which can still be added, are in collapsible sections for a cleaner look.
- **Supplier Item:** After saving the core (or parent) **Item Details**, select the **Supplier Item** tab to enter supplier details. If you are inside a catalog, the supplier name is prefilled. New permissions let you assign separate access to the item details and supplier item tabs, giving you more control over sensitive supplier fields related to contract and pricing. See [More Precise Control Over Item Access](#).

When viewing an item from the catalog, the application displays the Item Details tab by default. You can use the Supplier Item tab to view specific supplier-related data or use the breadcrumbs to navigate between the core item details, the supplier item, and the Items data table.

For more information, see:

- [Catalog Management](#)
- [Create or Edit Catalog Items](#) (suppliers)

Level 2 Punchout Support

Manage the visibility of specific punchout items in Coupa search using hosted catalog tools to guide user purchases in Coupa while directing buyers to supplier stores for real-time pricing and availability.

Now you can use Level 2 Punchout to manage specific punchout items you want to highlight in Coupa searches before users navigate to the supplier's website to purchase. Admins can manage punchout items just like hosted catalog entries, using labels, tags, and other tools to guide users toward buying preferred items. In search results, as well as in catalogs, the search panel, and item details pages, Level 2 items show a **Visit Store** button that directs users to the supplier punchout site for current pricing and other details needed before completing the purchase on Coupa.

Unlike Coupa Open Buy, which offers a seamless search experience across a supplier's full catalog with real-time pricing and availability, Level 2 Punchout lets you manage specific punchout items to highlight them to users, while relying on supplier websites where necessary for current pricing, availability, and customizations before users finalize a purchase.

Figure 1. Level 2 item in search

Admins can enable individual punchouts for Level 2 by navigating to **Setup→Items and Catalogs→Punchout Sites**. Edit a specific punchout and look for the Level 2 Punchout section. Choose whether Level 2 is used for all, none, or select individual items associated with the punchout, and save your changes. If you chose individual items, you can then edit item records for that supplier and configure the **Level 2 Punchout** options. The supplier part number (SPN) is required for Level 2 items to ensure users land on the correct item's page when visiting the supplier's store. However, you don't have to enter a price for an L2 item, since users see a message directing them to the supplier's store for up-to-date pricing. If you mark an item as L2 and enter a price, users see a message that the price may vary on the supplier's website.

Users can add Level 2 items to order lists, but if they add the entire order list to their cart, the Level 2 items are excluded until after the user visits the supplier's website. Once the user finalizes the price and any other necessary purchase details, they are returned to Coupa with

the Level 2 item automatically added to their cart.

To prevent duplicates, Open Buy versions of items that match Level 2 Punchout records are hidden from search results.

NOTE: Level 2 Punchout items do not appear in mobile searches because mobile devices do not support Level 2 punchout functionality.

For more information see:

- Level 2 Punchouts (pending)
- [Coupa Open Buy](#)
- [Punchout Site Settings](#)
- [Using Order Lists](#)

More Precise Control Over Item Access

Gain greater control over who can manage non-catalog items, by assigning separate permissions for editing core item information versus editing supplier-specific details, including sensitive fields around pricing and contracts.

Now that the new user interface experience separates item information into two tabs, one for core **Item Details** (general item information that isn't specific to a supplier) and one for **Supplier Item** details, you can more precisely control who can modify the information in these two separate sections, giving you greater control over sensitive information. Previously, the existing Add (and Remove) Supplier Item permissions allowed you to control who could create and edit item details under **Setup→Items and Catalogs→Items**, however this included the item name, type, UOM, and the manufacturer's name and part number, *plus* supplier-specific information, including pricing.

New supplier-specific permissions let you assign separate access to the supplier item details, allowing tighter control over sensitive information such as the supplier price and contract. The following table shows the two existing permissions along with the three new supplier-specific permissions:

Table 1.Item permissions

Permission name	Description
Add Supplier Item (existing permission)	Lets you create a new item, including both the core item information and supplier-specific details.
Remove Supplier Item (existing permission)	Lets you delete an item, removing both the core item information and supplier-specific details.
Edit Supplier Item (new permission)	Lets you modify the Supplier Item section of an item, when using the new user interface experience for items.
Edit Supplier Item Price (new permission)	Lets you modify the Pricing Type , Full Price , and Currency fields in the Supplier Item section of an item, when using the

Permission name	Description
	new user interface experience for items. A user with the Edit Supplier Item Price permission must also be assigned the Edit Supplier Item permission.
Edit Supplier Item Contract (new)	Lets you modify the Supplier and Contract fields in the Supplier Item section of an item, when using the new user interface experience for items. A user with the Edit Supplier Item Contract permission must also be assigned the Edit Supplier Item permission.

The new permissions control access both through the new user interface and the item bulk loader. However, you need both the Add Supplier Item and Edit Supplier Item permissions to initially create, as well as update, a supplier item through the loader. If someone without the appropriate permissions attempts to submit edits to an item through the bulk loader, any changes to restricted columns are ignored and a warning message is displayed.

Figure 2. Loader error

Permission warning: You are not authorized to upload supplier item information

Permission needed: Items Add supplier item, Items Edit supplier item

Allowed Roles: Admin, Buyer, Inventory Manager, User - Supplier Item, Full Item Access, Add Item Access, Edit Item Access, Add Parent Item Access, Update Parent Item Access, Allow Price Edit, Allow Contract Edit

User has: Create Parent Item (User, User - Parent Item)

The following columns will be ignored:

Supplier, Supplier Number, Preferred, Contract Number, Item Access Groups, Pricing Type, Price, Currency, Supplier Part Num, Supplier Aux Part Num, Lead Time, Manufacturer, Savings %, Minimum Order Quantity, Order Increment, Availability, Availability Date, UNSPSC Code, Contract Term, Supplier Item Purchasable, Catalog, Price (Tier 1), Price (Tier 2), Price (Tier 3), Price (Tier 4), Price (Tier 5), Price (Tier 6), Price (Tier 7), Price (Tier 8), Price (Tier 9), Price (Tier 10), Price (Tier 11), Price (Tier 12), Price (Tier 13), Price (Tier 14), Price (Tier 15), Price (Tier 16), Price (Tier 17), Price (Tier 18), Price (Tier 19), Price (Tier 20)

If you have permissions to modify supplier item details, but not permissions to create the core item details, you can use the item bulk loader only to add supplier item details to an item that has already been created.

Updated Catalog Item Approval Conditions

Make catalog item approvals more efficient and compliant by setting new conditions to separate the approvals of core item information from supplier-specific details.

Now that the user interface separates item information into two tabs, one for core **Item Details** (general item information that isn't specific to a supplier) and one for **Supplier Item** details, you can create separate catalog approval workflows based on each of these distinct activities, ensuring more precise control over who is asked to review specific types of catalog changes. Previously, core item details (sometimes called the "parent item") and supplier-specific information were created in the same step. You could configure the **New Items Created** condition to trigger approvals whenever a new item was created. This meant everyone on the approval chain had to review all details about the new item. This condition continues to work for existing catalog items, however, now you can be more precise about which information in a new or updated item triggers a **Catalog** approval workflow, by using one of the following new conditions:

- **Parent Item Created** - triggers the Catalog approval chain when a new catalog item is created and saved with the core item details (the item name, type, UOM, and the manufacturer's name and part number).
- **Parent Item Updated** - triggers the approval chain when a catalog item's core details are edited (without changes to any supplier-specific information).
- **Supplier Item Created/Updated** - triggers the approval chain when supplier-specific details are initially added, or edited, and saved to an item. This can include pricing, currency, and contract information.

Figure 3. Catalog approval chains

Approval Chain Conditions

Coupa Inventory

See the features added to Coupa Inventory for the May 2026 Release (R45).

Supplier Visibility for ASN cXML Errors

Suppliers can track cXML Advance Ship Notices (ASNs) stuck in transmission.

Suppliers can manage cXML transmission errors related to ASNs directly within the **cXML Errors** section of the Coupa Supplier Portal (CSP). This feature provides suppliers with self-managed access to track and resolve issues when sending ASNs through cXML.

Suppliers navigate to **Setup**→**cXML Errors**. In the **ASNs** tab, they view a unified list of transmission errors for all their customers. The data table includes:

- **ASN #:** Displays the reference number for the order associated with the error.
- **Error Date:** Shows the specific date and time the transmission failed.
- **Error Type:** Describes the type of the failure, such as the request failing to validate against the Document Type Definition (DTD).
- **Request:** Select **View Request** to inspect the cXML data sent by the supplier.
- **Error Response:** Select **View Response** to see the error message returned during the transmission attempt.

Suppliers can use the search bar or advanced filters to locate specific failures by ASN number, date, or error type. When you resolve an error in your Coupa instance, the updated status reflects in the supplier's view on the CSP.

Coupa Services Procurement

See the features added to Coupa Services Procurement for the May 2026 Release (R45).

Services Procurement Approvals Enhancements

Use dynamic approval roles to route services transactions to the correct managers automatically, with additional enhancements for creating more precise services procurement workflows.

You can now use dynamic manager roles and additional service-specific conditions to ensure that service requisitions, purchase orders (POs), and other transactions are sent to the appropriate managers for approval. By adding dynamic **Line Manager** and **Worker Assignment Resource Manager** roles to your approval chains, the appropriate managers are notified when reviews are needed, eliminating the need for manual workarounds.

These dynamic approver roles, which now support management hierarchies and approval limits, can be added to the following approval chains:

- Service Sheets
- Service Sheets Void
- Worker Compliance Form
- Worker Assignment
- Worker Assignment Change
- Requisition (Line Manager only)
- PO Change (Line Manager only)
- Invoice (Line Manager only)

Figure 4.

Approvers

For the above conditions, identify the specific approval chain that must approve

☒ **Specific Approvers**

Select this option to specify one or more approvers.

Requested By: Worker Assignment Resource Manager

* Approver: Worker Assignment Resource Manager

Amount: Pick or enter limit

Meg

The specific **Line Manager** is determined from the requisition or order line, and the **Worker Assignment Resource Manager** is determined from the worker assignment. Approval chains using these dynamic roles cannot result in duplicate approvers. If a dynamic role would add a manager who is already explicitly configured in an approval chain, that approver appears only once.

In addition, when configuring **Approval Preferences** for service sheets under **Setup→Company Setup→Approvals**, now when you select to always add these two dynamic roles as approvers, it applies only for management hierarchy and exception handling chains.

Additional enhancements include:

- Add parallel approvers to service sheets approval chains to reduce cycle times
- Add new conditions to trigger service sheet approvals, such as whether service sheets were required, as well as the service line match type, and custom fields
- Designate an ultimate approver specifically for service sheet void requests (previously **service sheet void** workflows had to use the same ultimate approver you set for service sheet workflows). You can also enable a service sheet void chain to auto-approve

automatically, to reduce operational friction

- Use submission blocking, approval blocking, and submission warnings in **worker compliance form** approval chains

For more information, see [Approvals](#).

Simpler Configuration for Services Procurement

Manage more Services Procurement settings through the user interface, including a new Services Procurement setup page to improve visibility and control over your system behavior.

Admins can now view and manage Services Procurement settings under **Setup→Services Procurement→Services Procurement Settings**, a new central location that lets you customize more Services Procurement behavior to meet your specific business needs, without assistance from Coupa support.

The new page, which includes sections for general settings, service sheets, worker management, and job roles, contains all of the services procurement configuration options formerly found under **Setup→Company Information**, along with several settings that previously you could adjust only by contacting Coupa. Now you can perform more self-service from the user interface so your system preferences are clearer and simpler to manage.

Figure 5.

Services Procurement Settings

General Settings

System-wide services procurement rules that impact all users and workflows

- ☒ Enable Item (Amount) purchasing ⓘ
- ☐ Automatically default contract rates to requisition and order lines when a contract is linked ⓘ

Default Unit of Measure for resource lines

Box ▼

ⓘ Unit of Measure must be specified to use Resource lines

Service Sheets

Rules that control how service sheets are reviewed, submitted, and modified over time

- ☒ Prevent approval of Service Sheets that would violate receiving tolerances

Submission Limits

Maximum weeks to report past services *

100

ⓘ Service sheet submission is limited to a maximum of 100 retroactive weeks

To help ensure data integrity, the Services Procurement settings page has built-in validations when you submit changes, such as minimum worker age and limits to when you can report past services. You can track all changes to the Services Procurement Settings page through an audit history section that shows what was changed, when, and by whom, helping you maintain governance and troubleshoot issues more effectively.

As part of this enhancement, the Worker Management entitlement was deprecated and is now included with the general Services Procurement license. This has no impact on existing functionality.

For more information, see [Requirements and Configurations](#).

Job Roles and Rates on Service Request Forms

Simplify intake and enforce compliance for recurring services by predefining job roles and rates on request forms.

Admins can simplify intake forms (also called easy forms) for buyers of frequently-requested services. When creating forms you can now predefine default Job roles and rates, removing guesswork for buyers, reducing downstream rework, and ensuring automatic compliance with worker policies and negotiated rates. Previously, buyers could select job roles and rates only after adding a requisition to their cart, and there could be guesswork involved in selecting from long lists of similarly-named job roles or rates. You can allow buyers to modify job roles or rates when submitting the request form, or restrict them to what is predefined.

Figure 6. Adding Job Roles to forms

The screenshot shows the 'Questionnaire' form editor interface. At the top, there's a '2 Questionnaire' header with a dropdown arrow. Below it, an 'Add Field' button is next to a search bar 'Start typing to add a ...'. A dropdown menu is open, listing several field types: 'Service Manager Email', 'Service Line Match Type', 'cf_req_line_lookup', 'CF: Dropdown', 'Rates', 'Job Roles' (highlighted in yellow), and 'Pricing'. To the left of the main form area is a 'Page 1' tab. The main form area is titled 'Job Roles field settings'. It contains a 'Label or Question' field with the value 'Job_Roles', a 'Required' checkbox (unchecked), and an 'Editability' dropdown set to 'Responder and Approvers'. Below this is a 'Hint or Additional Text' field with a rich text editor toolbar. At the bottom, there's a 'Job Roles +Add' button and an 'Encrypted' checkbox (unchecked).

Admins can now add the following when creating and managing service requisition line forms under **Setup**→**Platform**→**Forms**:

- **Contract Rates:** View and select approved rates tied to specific contracts to maintain pricing consistency.

- Applies to Service Amount and Resource Amount line types where you've added the **Supplier Information** field, specified the supplier, and selected a contract. For Resource Amount lines, the **UOM** field also must be added to the form before rates can be selected.
- Add the **Rates** field to the form questionnaire, and select **Contract Rates** in the **Rate Types** section. Depending on your configuration, one or more contract rates may be selected by default after choosing the contract.
- You can leave the defaults or select **Manage Rates** to edit which contract rates to predefine on the form.
- **Ad Hoc Rates**: You can predefine flexible, one-time rates for variable service pricing scenarios. After adding the **Rates** field to the form questionnaire, select **Ad Hoc Rates** in the **Rate Types** section and select **Manage Rates**. Instead of predefining ad hoc rates, you can select **Responders** in the **Editability** field to allow requesters to define ad hoc rates on their request.
- **Job Roles**: Predefine global job roles or ad hoc job roles directly on a form, or simply add **Job Roles** as a required field. After adding the **Job Roles** field to the form questionnaire, choose from global job roles or create ad hoc roles. A **Job Roles** column has been added to **Requisition Line Form Responses** to capture roles submitted through easy form requests.
- **Service Resource Amount** line type: You can default requests to a new resource-based requisition line type which supports multiple rates for time-based services.

NOTE: After upgrading to R45, any Rate Card fields or rate card forms are converted to Ad Hoc Rates.

Preserve Item Purchasing with Services Procurement

The **Item (Amount)** line type is now available for fixed-price, non-services requisitions, even with Services Procurement enabled.

Procurement customers who enable Services Procurement can ensure there is no impact to their non-services requisitions or purchase orders that use the **Item (Amount)** line type. Previously, enabling Services Procurement meant you couldn't use **Item (Amount)** lines on new non-services requisitions, while existing **Item (Amount)** lines on requisitions, forms, integrations, and approval chains were converted to **Service (Amount)** lines, which could disrupt financial processing and reporting.

Figure 7. Item purchasing with Services Procurement

The screenshot shows a web form titled "Write your request". A red rectangular box highlights the "Line Type" and "Type" selection area. In the "Line Type" section, there are three radio buttons: "Service", "Item", and "Quantity". The "Item" radio button is selected. In the "Type" section, there are two radio buttons: "Amount" and "Quantity". The "Amount" radio button is selected. Below the highlighted area, there are three input fields: "Non Catalog Item Description", "Supplier", and "Commodity". At the bottom of the form, there are three labels: "Backing Document", "Savings %", and "Payment Terms".

Now, after a Procurement customer enables Services Procurement, they can choose an **Amount** or **Quantity**-based **Item** line type on requisitions through the user interface, as well as the API, and CSV loaders. There is no impact to any requisitions, orders, integrations, and approval chains that included **Item (Amount)** lines before Services Procurement was enabled. However, you can manually convert existing **Item (Amount)** lines to **Service (Amount)** lines by selecting **Load from File** to upload requisition line edits in bulk. In addition, you maintain your preferences for matching and receiving **Item (Amount)** lines, avoiding the need for service sheets where they are not required.

This new behavior is controlled by an admin setting, under **Setup**→**Services Procurement**→**Services Procurement Settings**→**Enable Item (Amount) Purchasing**. To preserve item purchasing, existing Procurement customers have to explicitly turn on this setting after enabling Services Procurement.

Sourcing for Service Workers

Find contingent workers to fill the job roles you need by using Coupa Sourcing to solicit and evaluate bids from a range of staffing firms, rather than relying on external systems or manual tracking.

You can source and select external service workers directly within Coupa by linking job roles to sourcing events, allowing you to manage the end-to-end recruitment of contingent workers without relying on external systems or paper-based processes.

Previously, Coupa Sourcing did not support job roles for services, forcing workarounds to thoroughly source for staff augmentation. Now you can create sourcing events from a service requisition or sourcing request form that specifies job requirements, including the role (you can select one job role per sourcing line) and number of workers required. Suppliers can respond to your events by submitting candidate profiles and resumes from their worker pools, with the capacity of each worker to fulfill the requirements. You can shortlist, evaluate, and ultimately award the bids with the best candidates. Once awarded, worker details are automatically added to the associated requisition to initiate the onboarding process.

Worker Assignment Approvals

Ensure that key stakeholders review and approve assignment details, such as dates, locations, worker qualifications, and onboarding requirements, giving you more control over service workers and assignments.

Two new approval chains let you ensure approval of new worker assignments before they start, as well as changes to existing assignments, strengthening governance over services procurement. If you’ve configured an approval chain, then new assignments created by suppliers enter a **Pending Approval** state, allowing stakeholders to verify that assigned workers have the necessary skills, and that provisioning requirements such as equipment or facilities access, along with other details, are accurate before the assignment becomes active.

You can control changes to submitted assignments, including critical fields such as job roles or start/end dates, through a new change request process. When someone changes an assignment, approvers can see the original value and the proposed change, providing context so they can authorize or reject the change. When a change to an assignment is approved, the assignment’s history section lets you view all previous changes to the assignment, and a new version is created. Admins can select **Revise** to edit assignments without triggering approvals.

Figure 9. Worker assignment change approval

Change ID 1102

Pending Approval

Job Role

Job Category	Job Role
Product	Product designer
None	None
Work Arrangement	Working Hours
Remotely	Monday–Friday, 9 AM–5 PM EST
None	None

Admins can navigate to **Setup**→**Company Setup** →**Approvals** to create the following new approval chains:

- **Worker Assignment** - triggers when a new worker assignment is created.
- **Worker Assignment Change** - triggers when an existing worker assignment is edited.

When viewing an assignment that is under review, you can see the status of the approval chain at the bottom of the assignment details page, including the list of approvers and the actions you can take (depending on your permissions) such as **Approve**, **Reject**, or **Bypass**.

To support the new approval chains, you can now customize worker assignment standard fields under **Setup**→**Custom Fields**. Also, suppliers can now save assignments as drafts before submitting them, so they can ensure assignment details are correct before they are routed for review.

Other Services Procurement Enhancements

See the Guided Buying Agent, defaulting of contract rates, and pre-seeded worker processes displaying by default for Services Procurement customers only.

Request Creation Agent with guided buying

The Coupa Navi™ (Navi) Request Creation Agent, which allows you to create purchase requests from contracts and uploaded documents, now includes guided buying capabilities so users can purchase what they need through a simple chat interface, without having to navigate to find the appropriate request form.

You can open the Navi interface and select **Find a Form**, or directly type your request. Navi responds with clarifying questions to help find what you need. Navi evaluates your responses and recommends the appropriate purchase channel, such as an Easy Form or a Write a Request form, based on your organization's buying policies. Navi prioritizes channels according to those policies to help reduce non-compliant spend. Guiding users to the appropriate channels through Navi can help admins eliminate the need to manually configure every step of the procurement process in guided requests.

For more information, see:

- [Coupa Navi Agent Portfolio Expansion](#)
- [Convert Contracts to Requests with Request Creation Agent](#)

Default contract rates for resource amount-based requisitions

You can now ensure that all applicable contract rates are added by default to new Resource (Amount) requisition lines created from a contract, ensuring valid pricing that aligns with your contract rules.

This behavior is controlled by the admin configuration under **Setup→Services Procurement→Services Procurement Settings→Automatically default contract rates to requisition and order lines when a contract is linked**. With this setting enabled, contract rates that match your company's default UOM are automatically selected for the new line. You can manually deselect defaulted rates or choose alternate ones to ensure that only the rates most relevant to your request are submitted to the requisition.

In addition, when you create a requisition from a contract for a **Resource (Amount)** line type, the **Line Type**, **Supplier**, and **Contract** fields are now pre-populated.

For more information, see [Service Rates in Contracts](#).

Pre-seeded onboarding processes display in Process Automator for Services Procurement customers only

To prevent confusion, pre-seeded worker-onboarding compliance processes are now hidden from Process Automator for customers who do not use Services Procurement. Previously, these non-editable processes would display for all customers, potentially causing confusion. The seeded processes are also hidden from filters and search results if you don't use Coupa Services Procurement, so you only ever see the system processes relevant to your active configurations. In addition, Services Procurement customers can now filter the Process Automator data table to see only these pre-seeded processes at any time, by using the new **System Processes** custom view.

For more information, see:

- [Process Automator](#)
- [Automate Worker Onboarding and Offboarding](#)

Coupa Invoicing

See the features added to Coupa Invoicing for the May 2026 Release (R45).

Support for Brazil Tax Reform

Capture and validate new tax types, including CBS, IBS, and IS, through the user interface (UI), CSV, or API to comply with the Brazilian tax reform.

You can capture and validate new tax types to comply with the 2026 Brazilian tax reform. You can manage invoices containing CBS (Contribuição sobre Bens e Serviços), IBS (Imposto sobre Bens e Serviços), and IS (Imposto Seletivo) tax categories to prepare for upcoming regulatory changes.

For the 2026 test period, the Brazilian government requires suppliers and buyers to support new tax rate types without affecting the invoice gross total. To support this, Coupa Invoicing adds eight tax rate types for Brazil, including various forms of IBS and CBS.

On the tax lines level, you can use four new fields to capture specific monetary values and product tax classifications. The application uses the invoice date to determine tax behavior. For invoices dated in 2026, these new taxes don't increase the gross total, while for those invoices dated in 2027 or later, the values contribute to the total calculation. These fields are available through the UI, CSV, and API for both inbound and outbound transactions.

During the 2026 test phase, the new tax amounts don't increase the invoice gross total. This behavior changes automatically for invoices with a date of January 1, 2027 or later.

For more information, see [Americas CaaS-Compliant Invoicing for Brazil](#).

Certificate-Based Authentication for Poland KSeF

Authenticate with the Polish National e-Invoice System (KSeF) using digital certificates for compliance with the Polish government mandate.

Authenticate with the Polish National e-Invoice System (KSeF) using digital certificates. This enhancement allows you to transition from token-based to certificate-based authentication before the 2027 government mandate.

The Polish government is moving from authorization tokens to certificate-based authentication. While both methods are supported throughout 2026, only certificates are valid starting January 1, 2027. You and your suppliers can upload your KSeF online certificate, certificate key, and password directly into Coupa Invoicing.

This update supports both the invoice retrieval process for buyers and the issuance and clearance process for suppliers. To ensure a successful connection, you must provide all three required certificate components. Coupa Invoicing recommends switching to the certificate method as early as possible to avoid service interruptions when tokens are deprecated.

NOTE: Coupa Invoicing does not support the KSeF offline certificate issuance process. You must use an online authentication certificate.

For more information, see [EMEA CaaS Poland](#).

France E-Invoicing Compliance

Enable compliance with the France e-invoicing mandate by automating electronic address registration and invoice lifecycle reporting.

Manage domestic business-to-business (B2B) e-invoicing requirements to comply with the France e-invoicing and e-reporting mandate. Register your electronic address and automate the retrieval and reporting of invoice lifecycles mandated by the government.

Starting September 1, 2026, the French government requires businesses to exchange domestic B2B e-invoices through a Plateforme d'Attachement (PA), a certified official platform, and the Portail Public de Facturation (PPF), the official public invoicing portal. To support this mandate, you can register a unique electronic address in Coupa Invoicing. This registration involves providing your electronic address details in the **Additional CaaS Information** section. The integrated partner then conducts a mandatory verification process before registering the address in the official French PPF and PEPPOL directories.

You can centralize all inbound electronic invoices through an automated workflow. Your suppliers send invoices to Coupa Invoicing using the PEPPOL network. The application automatically transforms mandatory formats, such as Factur-X, UBL, and CII, into the standard Coupa invoicing format.

To meet the invoice lifecycle reporting, Coupa Invoicing automatically generates a Cross Domain Acknowledgment and Response (CDAR) XML file when an invoice status changes to Approved, Disputed, Paid, or Void. Coupa Invoicing sends this file to the integrated partner, which provides the invoice to the PPF and the suppliers. You can track the current government lifecycle status directly on the invoice header. If you need to reject an invoice, the Void action activates mandatory invoice lifecycle reporting where you must select a legal rejection reason.

NOTE: The testing for these features begins in April and May 2026:

1. April 27, 2026
2. May 4, 2026

The official government mandate goes live on September 1, 2026.

For more information, see [EMEA CaaS - France](#).

Bulk Edit Invoice Lines Support on Single Page View

Copy, delete, and edit multiple invoice lines simultaneously to improve invoice processing.

To enable this feature, go to the **Setup→Company Information** page and select the **Enable bulk edit invoice lines on the single page view** option. You can use bulk actions, including copy, delete, and edit, from directly within the single-page or open form invoice view. This feature allows you to manage multiple invoice lines at once without switching to a multi-page view.

The bulk action buttons appear above the **Lines** section of your invoice, so you can select specific lines to duplicate them instantly, remove them after a brief confirmation, or update several fields across all selected lines in a single step. The bulk edit functionality allows you to modify billing accounts, contracts, categories, commodities, and tax-related fields, and supports additional business-specific fields to capture all required information. The bulk edit dialog respects your existing invoice presentation rules and system settings to maintain data integrity. For example, if you hide a specific field in your invoice settings, it does not appear in the bulk edit window.

For more information, see [Bulk edit invoice lines on the single page view](#).

Improved Supplier Selection for Inbound XML Invoices

Coupa Invoicing maps suppliers on inbound XML invoices using tax identification numbers, purchase order numbers, and manual mapping.

Coupa Invoicing uses tax identification numbers (IDs) and purchase order (PO) numbers to automatically identify and map suppliers on inbound XML invoices. This feature ensures accurate invoice processing even when supplier names in external applications do not match records in Coupa Invoicing.

When an inbound XML invoice arrives through SFTP or API channels, the application uses the following criteria to determine the correct supplier:

Selection Criteria	Description
Supplier Name	The application attempts to match the supplier name in the XML payload to a supplier record in the system.
Tax ID on the supplier record	The application checks if a tax registration or VAT ID in the XML payload matches a supplier record. If the application finds no match on the supplier record, it moves to the following selection criteria.
Tax ID on the remit-to address	The application checks for a matching tax ID on any remit-to address (RTA) records linked to a supplier. If multiple suppliers share the same tax ID, the application moves to the following selection criteria.
Purchase order number	If the invoice payload includes a PO number but no matching tax ID, the application uses the supplier associated with that PO. If the application can't identify the supplier record, the application requires the following selection criteria.
Manual mapping memory	An accounts payable (AP) user can manu-

Selection Criteria	Description
	ally select the correct supplier and select the Remember me checkbox. The application then automatically maps future invoices from that source to the selected supplier.

These additional mapping capabilities allow you to create invoices for the correct supplier even when naming conventions differ between external systems and the legal names stored in Coupa Invoicing.

For more information, see [Automatic supplier mapping for inbound invoices](#).

Link Amount-Based Purchase Orders to Quantity-Based Invoices

Link amount-based purchase orders to quantity-based invoice lines.

As an Accounts Payable (AP) user, you can change amount-based purchase orders (POs) to quantity-based invoice lines. This functionality supports the processing of quantity-based invoices required by regional compliance mandates, even when the corresponding PO is amount-based.

To enable this feature, go to the **Setup** → **Company Information** page and select **Enable automatic conversion of Quantity-based invoice line to Amount-based line when linked to an Amount-based Purchase Order Line**.

When you use the **Pick Order Line(s)** dialog, you can view and select both amount-based and quantity-based PO lines. If you select an amount-based PO for a quantity-based invoice line, the application automatically changes the invoice line type to amount. This conversion maintains the accuracy of your receipt processing and tolerance checks.

You can also see the column type in the **Pick Order Line(s)** dialog to identify the type of PO line.

The feature is available for invoices created through the following channels:

- Buyer-validated compliance service
- Direct SFTP

For more information, see [Link amount-based purchase orders to quantity-based invoices](#).

InvoiceSmash

See the features added to InvoiceSmash for the May 2026 Release (R45).

Extract Contract Reference Numbers from Invoices

Extract contract reference numbers automatically from invoices and populate the data to Coupa Core.

InvoiceSmash extracts contract reference numbers from invoices and sends the data to Coupa Core. This update captures contract details and provides a built-in feedback mechanism for extraction adjustments.

To enable this feature, navigate to **Setup**→**Invoicing**→**InvoiceSmash Setup** and select **Submit extracted Contract Number**. The application identifies the contract number on the invoice during the extraction process. The contract number information must exist in Coupa Invoicing to populate the field automatically.

You can view the extracted value directly in the user interface (UI). If the extracted information is incorrect or requires adjustment, select the feedback link associated with the contract number. Submitting feedback automatically creates a support request in InvoiceSmash for further review. This feature also includes localization support for the UI.

For more information, see [InvoiceSmash extraction support](#).

Convert Lines for Quantity and Amount Types

Create rules to convert invoice lines between amount and quantity types for specific suppliers.

As an Account Payable (AP) user, you can create rules to automatically convert invoice lines between amount and quantity types for specific suppliers. You can manage how the application processes and displays incoming invoice data from your suppliers.

You can define line type conversion rules for localized InvoiceSmash invoices in edit mode. These rules apply in bulk to all subsequent invoice lines from the designated supplier.

To define a rule, select the **advanced field settings** icon located next to the invoice line fields. In the dialog, choose one of the following options for how you want the application to extract invoices from the supplier:

- **Quantity type lines:** The application processes incoming lines as quantity lines.
- **Amount type lines:** The application processes incoming lines as amount lines.

The application uses the following logic to convert lines:

Conversion Direction	Logic Options
Quantity to Amount	The application calculates the line amount as follows: Amount = Quantity x Unit Price
Amount to Quantity	You can choose one of the following: • Set the quantity to the total amount and the unit price to 1. • Set the quantity to 1 and the unit price to the total amount.

For more information, see [Convert lines for quantity and amount types](#).

Edit Starting Check Number

Starting check number is editable for already active accounts.

When you create a Company Financial Account (CFA) for issuing checks, you must assign a starting check number. To make managing your accounts more flexible, the **Starting Check Number** field is editable.

To change the starting check number for a CFA, click to edit the account, add a new number to the **Starting Check Number** field, and save. After you save, check numbering for the account starts with the new starting check number. It does not change historical data and does not change the numbering of already issued checks.

Because the check numbering begins with the new number, duplicate check numbers are possible. If you set the new starting check number to a number lower than the last issued check, it may result in checks with numbers that have already been used for this account. This duplication may cause your bank to reject the new check as fraudulent or may impact payment if a stop payment has been issued on a duplicate check number. Best practice is to discuss the check numbering policy with your bank before making this change.

The application also validates the starting check number when you create a new CFA or edit an existing one. If your entry fails the validation, you see this error message: "Enter up to eight digits. Do not use leading zeros, letters, or special characters."

Enable Single Payment per Invoice

Allow suppliers to receive a separate payment for each invoice instead of grouping invoices into a single payment.

Some suppliers do not want multiple invoices grouped into a single payment, as they need to receive one payment for every invoice. You can enable this on the supplier record using the Enable Single Payment per Invoice checkbox. When the feature is enabled, merging is disabled for the supplier, so every invoice from that supplier creates a single payment.

By default, the Enable Single Payment per Invoice checkbox is unchecked. To enable the feature for a supplier, navigate to the supplier record, click to edit the record, scroll down to the Payments section, and check the box.

You can also enable the feature at the level of the supplier site. To do so, go to the supplier record, navigate to the supplier sites, and click to edit a supplier site. Within the edit window for the site, you can check the Enable Single Payment per Invoice checkbox. This enables the feature only for this supplier site. It does not enable the feature for the supplier as a whole or for other sites belonging to this supplier.

If you use TransferMate for digital payments, each separate payment leads to a separate direct debit, meaning that you will see more transactions.

Enhancements to Payment Instructions

We refine the user experience with Payment Instructions for digital payments made by Direct Bank Integration (DBI).

Payment Instruction functionality gets a set of upgrades to refine and streamline your payment processing.

Payment Instructions

When the application validates each of your payments, it also checks whether **Payment Instructions** are mandatory. If there are mandatory instructions, the application also checks what are the specific requirements for that payment. Where the requirements are not met, an error message clearly indicates that **Payment Instructions** are missing or invalid and requires you to correct the issue before you can send the payment for approval.

When editing **Payment Instructions**, the simplified dialog only shows the mandatory fields for that payment. You can add optional fields using the **+ Add Instruction** button. Click the button, select a field type, and enter the information. You can also remove optional fields by clicking the trash icon.

As an additional level of guidance, each **Payment Instructions** field features a tooltip with guidance about any requirements for that field type.

Remittance Information

Remittance Information is now separate from **Payment Instructions**. They are located next to each other in the payment data.

Because they are separate, you can view and edit **Remittance Information** independently.

Streamlined payment autofill feature

Payment Type and **Payment Instructions** from previously successful payments are automatically populated with future payments, based on the last successful payment with the same combination of the following:

- Pay-From Account
- Pay-To Account
- Transfer Type
- Payment Type

As well, the prior payment's status must be **Successfully Completed**.

An icon next to the **Payment Instructions** link within the payment data indicates when this feature has been successfully applied.

The **Payment Type** and **Payment Instructions** can also be edited or removed. Validation of supported **Payment Types** and required **Payment Instructions** still applies after any change.

Introduction of Payment Type

The Payment Type menu allows you to choose a more specific type of payment instrument for each of your payments.

The available options for **Payment Type** follow from the chosen **Transfer Type**. For example, if the **Transfer Type** selected is ACH from a U.S. domiciled Company Financial Account, the available options for **Payment Type** are variations of ACH, such as CCD, PPD and IAT.

This feature is available to users who make payments using Direct Bank Integration (DBI) and the available options for **Payment Type** get determined by the options supported for both the pay-from and pay-to banks.

When you create a payment, you must select the **Payment Type**. If you later edit the payment, the change may clear the **Payment Type**. For example, if you change the **Pay From Account**, the new account might support different **Payment Type** options than the previous selection, meaning that you need to select a new **Payment Type**. In cases like this, the payment shows an error which you need to resolve before the payment can proceed.

In many cases, there might only be one available option for **Payment Type**, given the selected **Transfer Type**. In this case, the **Payment Type** menu is greyed out, but still shows the selection. When this is the case, the only way to change the **Payment Type** is to change the selection for **Transfer Type** or **Pay From Account**.

Remove a Payment from an External Payments Batch

Remove problematic payments from external payment batches to keep your payment processing running smoothly.

Customers who use Direct Bank Integration (DBI) can remove individual payments from external payment batches. This is to ensure that an error relating to a single payment does not prevent you from processing the rest of the batch. The external payment batch must be in **Draft** status.

The batch history records any deleted payments:

- User who deleted the payment
- Date and time stamp

Deleting the payment only removes it from Coupa Payments and does not make any changes in the originating system or in the imported file. You can fix and re-import the payment with the same source reference, if needed.

Set Required Supporting Documents for Supplier Payment Methods and Accounts

You can now set standard requirements for the supporting documents that you need from suppliers when they configure Bank Transfer payment methods in the Coupa Supplier Portal (CSP). This lets you approve payment accounts faster and adds an audit trail that shows when each document was uploaded.

As Payments Admin, you access the new requirement settings at **Company Information > Default Payment Types**. Under **Bank Transfer**, activate the checkbox **Require Supporting Documents**. You then must select one or more documents from the list (voided check, bank account verification letter, bank statement, business registration document). Your selected requirements apply to new or newly updated bank payment methods from the supplier side.

Default Payment Types

Please choose the payment types your company will use to pay your suppliers. Payment Type selected will default to all your supplier records.

☒ **Bank Transfer**
include Banking Information

☒ **Require Supporting Documents**
Select the documents the supplier must provide

- ☐ Voided Check
- ☒ Bank Account Verification Letter
- ☒ Bank Statement
- ☒ Business Registration Document

You can now see when suppliers upload supporting documents. Open the detail view for a **Supplier Payment Account** and use the **Supporting Documents** option to view the document. You see the timestamp for each upload so you can confirm and track when suppliers provide supporting documents.

From the CSP, suppliers have a guided experience with clear information about your required supporting documents, based on how and when they add and configure payment methods. For example, when a supplier adds a bank account while onboarding a new supplier, they see a mandatory **Supporting Documentation** section with any documents you require. If existing suppliers have never added supporting documents to a payment method, the system will not let them proceed unless they add at least one supporting document.

When an existing supplier adds a new payment method, the CSP also shows an optional

supporting documents section plus a checklist of all document types requested by any of that supplier's linked customers. When the supplier chooses which customers to share the payment method with, the CSP flags the attachment of supporting documents as mandatory if any selected customer (including you) requires them, and shows the supplier which customers are asking for which documents.

Before a supplier sends you a document, the CSP clearly warns them not to upload customer-specific content, because every document attached to a payment method is visible to all Coupa customers linked to that method.

For more information, see [Set Payment Preferences for Suppliers from Coupa Pay](#) and [Supplier Payment Account Setup](#).

Roles and permissions

Integrations

None.

Availability

This feature is part of Coupa Pay. It is off by default and configurable.

You must have Coupa Pay or Coupa Pay + SIM entitlements to share your default payment types with suppliers, and you must have the **Payments Admin** role to access **Supplier Payment Accounts**.

Release Note Changes

None.

Withdraw Submitted Payment Batches

Withdraw a payment batch from the approval queue after submitting it.

As the submitter, you can now withdraw a payment batch in the status Pending Approval. This allows you to revert the batch to Draft status without needing an approver to first reject it. Only the user who submits a payment batch has the ability to withdraw it.

Withdrawing payment batches is supported for every type of batch:

- Invoice
- Expense
- One time payment or fund transfer created in the Payments module
- Fund transfer created in Treasury Management
- External payment
- Bank ready file

The new permission **Withdraw Payment Batches from Approvals** automatically gets assigned to all users with any payment Processor or Admin roles.

Roles and permissions

Digital Payments Other Enhancements

See other Digital Payments enhancements made for the May 2026 Release (R45).

Remittance information for external payments

External payments now support remittance information when used with Direct Bank Integration. This information gets imported from the external payment file and gets included in the file sent to the bank upon releasing the external payment batch. Remittance information is visible within the application in the **Remittance Information** field within the payment line of the payment batch. As the originating system for the payment is not Coupa, this field is not editable.

For more information, see [Pay External Payments](#).

Execution date for external payments

For customers using Direct Bank Integration (DBI), external payment support expands to include a requested execution date. The execution date must be included in the imported external payment file. The requested execution date cannot be added or changed for an external payment batch after importing it. If the requested date is in the past, the application imports the requested date, shows the standard error message for dates in the past, and the payment gets executed immediately.

For more information, see [Payment Execution Date](#).

Multiple Beneficiary Payment Accounts for a single beneficiary

For external payments, the application allows a single beneficiary to have more than one active Beneficiary Payment Account (BPA). If an imported external payment file contains new account information for a beneficiary who already has a BPA in your system, the application simply creates a new BPA.

For more information, see [External Payments with Beneficiary Payment Accounts](#).

External payment notification refresh

Notifications for external payments get updated to match notifications for other payment types. This brings the external payment experience in line with the experience for other payment types.

For more information, see [Pay External Payments](#).

Release notification for users with access to legal entities

With Legal Entity Security Groups (LESG), access to legal entities gets constrained according to the groups accessible to each user. As a payment releaser, you must have access to all legal entities in a payment batch in order to release that batch. Because of that, the release notification only gets sent to users with access to all involved legal entities.

This only applies to customers who use LESG. If you do not have LESG configured, the notification goes to all users with permission to release payment batches.

For more information, see [Legal Entity Security Groups](#).

Refine default SPA selection for invoices

A supplier might have two Supplier Payment Accounts (SPA) where one is active and the other is pending approval. Instead of defaulting to the active account, the application takes the account on the invoice, even if the account is pending approval.

If the SPA is pending approval, the status on **Invoices to Pay** shows as **Pending Pay-To Account Approval**.

Positive pay file for JP Morgan Chase

In addition to the existing supported positive pay formats, the application now supports a format for JP Morgan Chase (JPMC). If you want to use positive pay with JPMC, check with your bank to ensure that the correct version is supported.

For more information, see [Positive Pay File for Check Payments](#).

Virtual Card Optimization

See the features added to Virtual Card Optimization for the May 2026 Release (R45).

Coupa Card Real-Time Charges Improvements

With the Coupa Card, you now get instant visibility into your Coupa Card spend the moment a charge is authorized.

Coupa Card charges are captured and displayed within the moment the card authorization is created. The UI is updated to include moving Coupa Card charges into a new **Charges** tab with separate sections for pending and posted charges. The pending charges section displays real-time authorization charges that have not been settled yet. Describe the feature (400 words max).

In **Payments** → **My Payments** → **Charges** you see Posted Charges and Pending Charges.

- **Pending:** the charge is authorized and is holding funds on your card. These are charges that are not settled yet. The funds are reserved and unavailable for other spending.
- **Posted:** the charge is cleared and is ready to be included in your expense report or processed for payment.

Additionally, when you navigate to a Coupa Card view, you see **Posted Charges** and **Pending Charges** as well.

When a charge is created, you receive a push notification from the Coupa Mobile app, alerting you to attach receipts and complete missing information (only for settled charges). You can attach receipts to pending charges directly from the web or Coupa Mobile.

Coupa Pay Secure Bulk Upload for Employee Payment Accounts

Securely create employee payment accounts in bulk through a secure, privileged admin-only file upload.

As an Expense Payments Admin with a privileged role, you can bulk upload to create employee payment accounts for large user populations, including employees who do not have mobile devices for multifactor authentication (MFA). You can navigate to **Setup > Payments > Employee Payment Accounts** and use **Load from file** in the **More** menu to upload a CSV file for employee payment account records. To enable this feature, contact Coupa Support.

NOTE: The maximum file size is 50MB. The CSV uploader creates new records, no updates are made to existing records.

To ensure your identity is valid and bank information is processed securely, you are required to enter MFA before uploading the file. After completing MFA and uploading the CSV file, the system processes the data and permanently deletes the file immediately after processing. The file is not stored in logs and is not available for download from any system location.

Coupa Card: Brex Account Connection Flows

Existing Brex users can connect their accounts to Coupa Card. This update removes onboarding friction, enabling customers to leverage their existing Brex legal entities and billing structures directly within the Coupa ecosystem.

Coupa Pay admins can link an existing Brex account to issue a Coupa Card. You can connect a customer's existing Brex account with a Coupa account for customers who already have a Brex account and want to use Coupa for related use cases without needing additional underwriting. To enable this feature, contact Coupa Support.

This feature allows organizations already using Brex to integrate their Brex account with Coupa Card. Once connected, the system guides you to **map legal entities** between Coupa and Brex.

As a Coupa Pay Administrator, you can find this by navigating to **Setup > Payment Partner Connections > Connect Brex Account**. This prompts a multi-factor authentication (MFA) process. After authenticating, fill in the information in **Create new Payment Partner**, select the **Legal Entity**, **Brex Legal Entity**, and **Currency**. Coupa then creates a Coupa Card Payment Partner Connection to issue the Coupa Card.

Treasury Management

See the features added to Treasury Management for the May 2026 Release (R45).

Treasury Management

See the features added to Treasury Management for the May 2026 Release (R45).

Treasury Management General Enhancements

See the general enhancements added to Treasury Management for the May 2026 Release (R45).

Coupa Navi introduced for Treasury Management

You can now access the Coupa Navi™ (Navi) agent from the Treasury Management user interface, similar to its functionality on Coupa Core. With this release there is not a dedicated Treasury Management AI agent, but you can leverage Navi's Knowledge Agent for Treasury-related prompts, which searches the Coupa Documentation for your query.

To use Navi, from the Core platform you must activate the Coupa Navi AI Agent License for your user. Then go to **Company Setup > Company Information**. Under System Options, go to **Generative AI** and activate the option **Enable Generative AI For Platform Capabilities** and the suboption **Knowledge Agent**, as well as any other agents you are licensed for.

From **Generative AI**, use the links to review Coupa's AI terms and conditions and legal policies before you use Navi, which you accept when you save your selection. Contact your Customer Value Management (CVM) representative if you have any questions about Coupa's AI agents.

For more information, see [Coupa Navi](#) and [Answer Questions with Knowledge Agent](#).

More self-service for integrations and automation

Use expanded self-service integrations and advanced scheduling options for Treasury objects from Coupa Core. Now, you can leverage default **Custom Page Views** (CPVs) for your automation users to set up and run automated **Classic Statement Export** and **Classic Table Export** for menu items in the classic interface.

The new custom export integrations include **Valuation**, **Cash Flows**, **Foreign Exchange Options**, **Money Market Options**, **Account Statements (classic)**, and **Intercompany Account Recorded Export**. You also have an updated scheduler with expanded Cron settings to configure delivery times and dates for all Treasury outbound integrations.

While these SFTP exports are currently available from the classic interface, switching to the enhanced self-service functionality from Core gives you more transparency, flexibility, and scheduling for your integration runs. You also benefit from synergy between Treasury Management and the Core platform, such as auto-generated multiple SFTP accounts and customizable integrations.

If you use the existing classic export functionality, you can start using the new functionality to streamline your integration workflow ahead of the migration from the classic SFTP export, which

is planned for an upcoming release.

For more information, see [Schedule Automated Processes from Treasury Management](#).

Use multiple SFTP accounts with Treasury integrations

You can now create up to eight SFTP accounts for your Treasury outbound integrations from the Coupa Core platform. This lets you use separate accounts for differing encryption methods and manage access for multiple enterprise resource planning (ERP) systems, for example. You can then choose from your configured SFTP accounts when you configure the outbound Treasury integration from Integrations in Core.

You create and configure the Treasury integrations in Core at **Integrations > sFTP Accounts**. You can use username and password or Secure Shell (SSH) key-based authentication, which generates SSH keys when you create the SFTP account in Core.

For more information, see [Treasury sFTP Integrations](#)

Custom file naming for Treasury outbound integrations

You can customize file names for outbound integrations from Coupa Core, with options that include strings with business objects, dates, and times. This specified file naming can be critical when you export multiple original bank files and original statements in a single integration run, for example for EBICS transactions. While standard integrations use Coupa's default naming tokens, you can give custom exports additional specific patterns or tokens, as well as file extensions where available.

Activate the new **File Naming Mode** when you create or edit an integration to assemble your custom integration name, which the system then validates before you can save it. When the integration exports zipped files, the custom naming is applied to the files within the enclosing ZIP folder, while the ZIP folder itself is named according to Coupa's standard naming convention.

For more information, see [Treasury CSV Exports](#).

Streamlined profile setup and provisioning for Treasury mobile app

Your users that need the Coupa Treasury Mobile App for multi-factor authentication (MFA) at login now have a simplified, automated experience when they set up a new profile or provision the app. The new streamlined experience is only available for users that are synced to Coupa Core and log into Treasury Management with single sign-on (SSO).

Now, your synced users that don't have the mobile app but are flagged to require MFA for Treasury access see a screen to set up the app for MFA when they login from Core. The new

screen has everything you need in one place: QR codes for app download, setup instructions, and access to the app. The guided setup automatically provides the correct Treasury hosting URL, username, and a time-limited app password for the user's profile setup in the Treasury Mobile App. The 8-character password is generated, stored, and then expires after 15 minutes, so users can onboard a new device or set up their profile without help from an administrator, while admins benefit from strong security controls.

If a user is allowed to reprovision devices for the mobile app, they can also open the new authentication screen from the **User Menu** in Treasury Management, for example if they change to a new phone or need to create or reset an app profile. From the authentication screen, these users can also reprovision the app on a device if an admin has removed it from their security settings.

For existing Treasury mobile app users, their login credentials and the MFA process remain the same, unless an admin requires them to reprovision or change their authentication method. They can then use the simplified authentication screen to update their profile and reprovision a device.

Users who are not synced with Core cannot use the updated authentication process, but must follow the existing process for profile setup and provisioning within the mobile app.

For more information, see [Coupa Treasury Mobile App Guides](#) and [Enable Multi-Factor Authentication](#).

Multi-factor authentication from the Core platform for Treasury access

For payment authorization, admins can already require multi-factor authorization (MFA) from the Coupa Platform for users as an alternative to authorization from the Treasury mobile app. You can now also leverage Coupa Platform MFA for users to log into the Treasury Management application, rather than with the Treasury app. This is available only to users that are synced to Coupa Core and use single sign-on (SSO).

In the security settings for a user, you can now choose **Coupa Platform MFA for Login Authorization** in the **MFA for Treasury Access** menu. You can alternately still use **Coupa Treasury App 2FA for Login Authorization**. When you require users to use the Coupa platform MFA, they authenticate with the same MFA authenticator app that they use to approve Coupa Payment-related activities or to approve payments within Treasury Management. This gives both admins and system users a single, consistent MFA experience across Treasury and the rest of the Coupa platform.

From the **Users** menu item, the **MFA for Treasury Access filter** and column now let you select either the Coupa platform MFA or Treasury app 2FA. This replaces the **2FA Settings** option in

previous releases. For any existing custom page views (CPVs) that filtered for this setting, the old **2FA Settings** is removed and migrated to the new **MFA for Treasury Access** selection.

For more information, see [Users](#) and [Coupa Treasury Mobile App Admin Guide](#).

Bulk options to set recipients for scheduled Excel exports and Trading contacts

From the **Contact Persons** data table, you can now designate multiple recipients for scheduled Excel exports with the bulk edit option. These users can then receive automated exports of filtered data by email from menu items in Treasury Management that are integrated with the **Share Excel Export** scheduled process in Coupa Core. The exported files contain data based on automation views from menu items in Treasury Management.

From the **Bulk edit: Contact Person** dialog you can also designate multiple users for **Trading**, which authorizes them to make financial deals in the system.

For more information, see [Contact Persons](#) and [Schedule Shared Excel Export by Email](#).

Enhanced Dashboard widgets

Based on suggestions for the **Dashboard** from the Coupa Community Forum, you can now designate currency units for amounts in your widgets with the **Conversion** option. As on the **Balances** page, use the dropdown menus to change from default values (**Absolute** currency units and **Group Currency**) to see amounts by thousand currency units (**TCU**) or million currency units (**MCU**) converted to any supported currency. You can also select the number of decimal places for rounding.

With this release, users who have read-only permissions in your system can also add widgets to the dashboard. Read-only users can already save custom page views (CPVs) that are used to set up widgets, and the new enhancement gives them full access to configuring dashboards in the system.

For more information, see [Dashboard](#) and [Currency Conversion and Rounding](#).

Use Payment Reference for Payments Reporting

You now have the **Payment Reference** filter and column on the **Payments Reporting** page. The enhancement is in response to Coupa Community feedback, and lets you capture the payment reference when you use the option **Schedule Shared Excel Export by Email**. You can share the Excel export from **Payments Reporting** in Treasury Management or with the scheduled process from Coupa Core.

For more information, see [Payments Reporting](#) and [Schedule Shared Excel Export by Email](#).

Enhancements for System Messages

On the **System Messages** menu item you have new filtering options, including **Type**, **Topic**, **Message**, and audit details. The default view in the table now shows only notifications from the past seven days, giving you a clearer overview and faster page loading.

For more information, see [System Messages](#).

Select All option in dropdown menus for Columns

When you configure your **Columns** on menu items in the new Treasury Management interface, you now have a **Select All** checkbox. This lets you quickly select or deselect every available column from the dropdown menu when you set your data table views.

Release Note Changes

None.

Treasury Management Banking Enhancements

See the banking features added to Treasury Management for the May 2026 Release (R45).

Export fragmented camt statements in original format

When your bank sends you ISO20022 account statements in camt.053 (end-of-day) and camt.052 (intraday) format, they may break them into multiple fragments due to restrictions on the file size or the transaction volume. In the previous release, Treasury Management introduced support for capturing the fragments and assembling complete statements from the fragmented files.

You can now export assembled fragmented camt.053 and camt.052 statements and still capture the file fragments in their original separate formatting. The export works on the principle of fragment-in / fragment-out process.

You have multiple options to capture the original account statement fragments when you export camt statements, both from the new Treasury Management interface and with integrations from Coupa Core:

Account Statement menu item

Use the **Export Original File** row action or bulk option from the data table in Treasury Management. In your download folder, the original file fragments are then given a prefix to indicate the fragment numbers, for example "0_Part1of3".

Original format export

Automatically export your original account statement files to an SFTP location without manual downloads. You configure which statements you want to export using an automation view on the **Account Statements** page, and set up an original format integration using the **Original Account Statement** business object, along with other details such as the schedule, subfolder, and SFTP account.

All existing custom SFTP integrations that are set up using the automation view automatically reflect the fragmented file behavior. When the integration runs, you receive fragmented camt. statements if they have been imported.

Outbound API

From the user toolbar in Treasury Management or from the Coupa Core Postman Collection for API, you use two endpoints in a two-step process to request and export the original file fragments. Use the existing **GET API endpoint Cash Management - Original Account**

Statements to export the assembled statement. If it contains fragments, the API response has the information in three new fields:

- **isFragmented** (Boolean): Indicates whether the account statement was assembled from fragments
- **fragmentCount** (Integer): The total number of fragments used to create the statement
- **fragmentIds** (Array of Strings): A list containing the Unique Identifiers (GUIDs) for each contributing fragment

Use the new GET API endpoint **Cash Management - Original Account Statement Fragment** to retrieve each fragment individually. Pass each **fragmentId** from the array as the **{fragmentId}** path parameter. The API response returns the original fragment data in the following fields:

- **fileName** (string)
- **fileContent** (string)

All exports from the **GET API endpoint Cash Management - Original Account Statements** now automatically receive the new fields in the API response body.

For more information, see [ISO20022 in Treasury Management](#) and [Treasury Original File Export Types](#).

Filter and export incoming bank files retrieved by new EBICS solution

From the **Bank Files Overview**, you can now filter for bank files that enter the system with Treasury Management's new EBICS solution. The **EBICS** filter and column are updated to capture only bank files from the incoming channel for the new EBICS solution, while **EBICS (old)** captures incoming files from classic EBICS. When you create automation views on **Bank Files Overview** to capture incoming files from the new EBICS channel, you can then use the automation views from Coupa Core to schedule automated exports of the original bank files.

If you aren't using the new EBICS solution yet, you can migrate now to benefit from this update and other enhanced functionality, including the automated processes and integrations from the Core platform.

All your existing EBICS data is automatically migrated and given separate designations for either new or classic EBICS solutions. If you have existing custom page views (CPVs) that filter for EBICS incoming channels, the CPVs now capture incoming files for both **EBICS** and

EBICS (old) unless you update the CPV to capture a specific EBICS channel.

For more information, see [Bank Files Overview](#) and [EBICS in Treasury](#).

Retrieve historical EBICS data

As a user, you may want to access historical EBICS data from your bank. For example, you may need to access data provided before your EBICS connection was established or you may need files which failed to transfer successfully due to a technical issue.

With the **Request Historical Data** row action, you can access historical data with a few clicks from within the application.

The feature is available as a row action for **EBICS - Inbound Configuration**. Once you find the relevant contract, you can use the options button in the row for that item and select **Request Historical Data** from the options menu.

This opens a dialog where you can configure your request. For EBICS 2.5 (H004) contracts, you select from your previously configured order types. For 3.0 (H005) contracts, you select from BTF. You then choose the timeline for your historical data. The request covers all data for one order type or BTF which falls within the timeline you enter.

Once you submit your request, it gets logged on **EBICS - Communication Logs** and your request goes to the bank. When your request is successful, you can access the file on

Bank Files Overview.

For more information, see [EBICS - Inbound Configuration](#).

Duplicate check for Payment Verification

From time to time, you may have duplicate payments in your system. Although rare, this can happen due to technical issues along the communication chain or due to user error. To prevent duplicate payments from getting sent to the bank, potentially causing more issues downstream, **Payment Verification** adds a duplicate check.

Like with the rest of **Payment Verification**, the duplicate check identifies and blocks single payments and bulk payments with details. Bulk payments without details are not covered. The duplicate check is automatically enabled for accounts using **Payment Verification**.

Options get renamed to reflect the addition of duplicate check:

- **No verification**: This remains the same, as there is no verification for payments from accounts with this setting.
- **Basic Verification - Verify against block list and duplicate check**: Payments from the account get verified against beneficiary accounts on your blocklist and against the duplicate

check.

- **Advanced Verification - Verify against blocking rules:** Blocking rules always include the duplicate check. You can use the blocking rule to refine the way the duplicate check happens.

The basic duplicate check compares payments of the same amount, paid from the same account to the same beneficiary.

You can further configure the duplicate check as needed. Options include adjusting the number of days back the check looks for duplicates and specifying whether the check includes End-to-end Reference, Message ID, or Payment Reference.

As with the rest of **Payment Verification**, you can manually override a failed duplicate check in cases where a payment is incorrectly blocked.

For more information, see [Payment Verification](#).

Ignore action renamed to Discard on Account Statement Manager

On the **Account Statement Manager**, you now use the row and bulk action **Discard** if you need to clean up duplicate statements. The action was previously called **Ignore**, but moved the statement to the **Discarded** status, which the **Discard** option does with the new release.

This change makes your statement management more consistent, as previously both **Ignore** and **Ignore Account ID** actions were available on the **Account Statement Manager**. The **Ignore Account ID** action remains unchanged, and moves a statement to the **Account ID Ignored** status.

Renaming the **Discard** option now gives you a consistent separation of both these actions and their resulting statuses for a statement.

For more information, see [Account Statement Manager](#).

Release Note Changes

None.

Treasury Management Cash Management Enhancements

See the cash management features added to Treasury Management for the May 2026 Release (R45).

Split cash flows from transactions from intraday statements

You can now split cash flows coming from intraday account statements. From the **Cash Flows** and **Reconciliation** menu items, you have the option to split flows from transactions that have the source **Intraday**. The split flows are then not reconciled against an end-of-day statement entering the system, but rather against the original combined flow before the split.

This preserves your split transactions and saves you manual reconciliation work: when end-of-day statements arrive, your previously reconciled and split intraday transactions are correctly updated without losing any of your work or configurations.

For more information, see [Cash Flows](#) and [Reconciliation](#).

New fields for transactions in Account Statements outbound API

For the outbound **GET API Cash Management - Account Statements**, you now have three additional fields:

- **chargesAmount** (Integer)
- **originalAmount** (Integer)
- **originalCurrency** (string)

These fields are already available when you use the bulk and row actions **Export CSV** and **Export to Excel** from the **Account Statements** menu item, but now you can capture them when you use the API export. You access the API endpoints from Treasury Management with the **More options** button on the user toolbar, or from the Coupa Core Postman Collection for API.

For more information, see [Account Statements](#) and [Treasury APIs](#).

Classic payment processes and account statement import removed from Treasury Management

With the May 2026 Release (R45), all payment processes and account statement import are

transitioned to the new Treasury Management interface. The following legacy functionalities in the classic interface were no longer in use, and are now removed from the system:

Classic payment transmission

The former classic-based payment transmission capabilities MBS, FTX and UBS are fully retired. These options are no longer available in Treasury Management cloud environments and are now removed from the product. Any fields where these values existed are set to **None**, and all related classic pages, links, or other elements have been removed.

Classic account statement import

The legacy account statement import in the classic interface is also removed. This includes all menu items, links, and functionalities related to the classic import. Account statement collection and processing is fully covered by the new cash management solution.

This gives you cleaner navigation and settings in the system, focused only on the cash management and payment capabilities in the new Treasury interface. You have more consistent workflows without legacy paths that could cause inconsistent behavior, and benefit from ongoing enhancements that are only available in sync with Coupa Core.

With the update, there is no impact on your current Treasury Management processes. All actively supported payment and cash management capabilities continue to be available and are unchanged.

For more information, see [The New Cash Management Process](#).

Improved accuracy for calculating charges in camt.053

For charges contained in camt.053 bank files, the system previously only considered the fields for amount and credit-debit indicator in the statement, meaning that differing currencies were not taken into account. To correctly sum up the charges in the same currency, the system now also considers the camt.053 field **Charge Included Indicator** (ChrgInclInd).

Now when a statement has multiple charges, the system only includes charges that match the account currency and are marked for inclusion (ChrgInclInd value is "True") when calculating charge totals. This ensures that only charges in the same currency are summed up correctly, for example in the **Cash Flows** data table.

For more information, see [Account Statements](#) and [Bank Files Overview](#).

Enhancements for GL Entries

On the **GL Entries** menu item, you can use the **Booking Date** filter and column to see the booking date of the underlying cash flow in the system. This information is then captured in your

exports and outbound integrations. With the new release, any existing GL entries in your system without booking dates are given the creation date of the cash flow as the value for **Booking Date**.

Additionally, you can now generate GL entries for transactions from intercompany (IC) accounts in your system.

For more information, see [GL Entries](#).

Release Note Changes

None.

Treasury Management Financial Instruments Enhancements

See the financial instruments features added to Treasury Management for the May 2026 Release (R45).

Compliance with new SWIFT trade finance messaging

Ahead of the upcoming SWIFT Standards release in November 2026, Treasury Management updates your trade finance messaging to ensure it meets the new requirements. The changes particularly apply to Category 7 transmission and authorization messages, which now require additional structured address fields. These fields are populated from your **Participants** for **Guarantees** and **Letters of Credit**.

If your bank requires you to adopt the new messaging standards, you need to update the following **Advanced System Settings** to send and receive SWIFT trade finance messages, depending on the financial object:

- **Guarantees**
 - Variable: **TTGASWIFTVersion**
 - New value: 3
- **Letters of Credit**
 - Variable: **TTLCSWIFTVersion**
 - New value: 3

The system continues to support both old and new message formats until the new SWIFT release, allowing you to coordinate or test with your banks before the changes take effect. Any **Guarantees** and **Letters of Credit** entered in the system but not sent when the new requirements go into effect will have to be sent in the new format.

For more information, see [Guarantees](#), [Letters of Credit](#), and [Participants](#).

Enhanced reporting capabilities for Money Market Funds

From the **Money Market Funds** (MMF) menu item, you can now enter and track any MMF balance growth or reduction that falls outside the existing **Buy** and **Sell** options. This may be passive balance effects such as interest, which you previously could not capture for MMFs in the

user interface (UI). You now have a **Balance Change** option that lets you enter positive or negative **Transaction Amounts** (delta) to capture your incremental balance change. **Balance Change** modifies your holding balance but does not trigger any settlement instructions in the system, which ensures there are no reconciliation errors for the MMF transaction. You can select **Balance Change** when you edit or add a new MMF transaction, or can drill directly into an existing MMF transaction from the data table with the new row option.

For the inbound POST API **Financial Instruments - Money Market Fund Transactions** integration, you use the same API endpoint, but the **buySell** field now also supports the new **BalanceChange** transaction type plus an optional **fundBalance** field. You can provide either a transaction amount or a fund balance, and the system calculates the missing value and updates **buySell** if it doesn't match the actual direction of the change. As in the Treasury UI, **BalanceChange** allows negative values for **transactionAmount**, and for **buySell** the amount must remain positive.

With this release you can also use the GET API **Financial Instruments - Money Market Funds** to export MMF balances. You access the API endpoints from Treasury Management with the **More options** button on the user toolbar, or from the Coupa Core Postman Collection for API.

For more information, see [Money Market Funds](#) and [Treasury APIs](#).

Automated deal import for Deutsche Bank and Nordea

You can now use automated SFTP configuration to capture foreign exchange (FX) deals from the Deutsche Bank and Nordea trading platforms. The system leverages the 360T format and reuses 360T user and participant mappings to import the files. In addition to Deutsche Bank and Nordea files, Treasury Management's **SFTP Configuration** currently lets you set up automated deal imports from 360T, Instimatch, Bloomberg, and FX All, as well as deal matching confirmations from Fusion CMS.

You can also activate automated import from the **360T / Instimatch** page to upload any Deutsche Bank or Nordea FX deals waiting to be imported on the system SFTP server. You can also manually upload files from Deutsche Bank and Nordea from your computer, for example for testing purposes.

The system additionally captures any comments on your deal execution files when they are delivered from the trading platforms.

For more information, see [SFTP Configuration](#) and [360T / Instimatch](#).

Auto-approve server import only from trading platforms

A new system setting gives you more control over auto-approval when you import trade execution files. With the system setting **TT Import**, select the new option **Automatically set to**

approved for automated Trading Platform import only to specify auto-approval only for imports from your trading platforms. The existing option to auto-approve imported trade execution files is renamed **Automatically set to approved for all imports**, which also lets you auto-approve manual imports for IC trading.

For more information, see [System Settings](#).

Auto-accept FX deals for IC trading

You can now automatically accept all foreign exchange (FX) deals for intercompany (IC) trading that have amounts under an upper limit. With the system setting **TT - Limit**, activate the **IC FX Trading Auto-Accept** option. The system then automatically accepts all IC trading requests under the amount limit.

The upgrade saves you the effort of approving the FX deals manually from the **IC Trading Platform**, especially when the amounts for IC trading deals aren't critical to your approval process. You don't have to wait for other system users to accept your trading request if you don't have rights to the entity or counterparty, for example, since all requests under the limit are auto-approved.

For more information, see [System Settings](#) and [IC Trading Platform](#).

Naming for Credit Lines

You can now edit the names of your **Credit Lines** in Treasury Management. Use the **Internal Reference** field to give your credit lines unique names for easier management in the system. This can help you identify specific credit lines when creating charts and widgets on dashboards, for example.

For more information, see **Credit Lines**.

Release Note Changes

None.

Treasury Management Market Data Enhancements

See the market data features added to Treasury Management for the May 2026 Release (R45).

Enhanced currency unit handling and date categories for Bloomberg market data

Bloomberg market data subscribers in Treasury Management now have improved business logic for handling specific currencies for which Bloomberg does not provide the rate for a single unit of currency. An example is Japanese Yen (JPY) to Vietnamese Dong (DNG), where Bloomberg provides the rate with a quote factor of 100. The system now captures the quote factor and uses it to automatically normalize the rates to single currency units in Treasury Management. To leverage the new functionality, you must add the **QUOTE_FACTOR** field in your Bloomberg Data <GO> request.

Depending on the selected price category, the date category from your Bloomberg data was previously auto-mapped by the system and could not be changed. From the **Bloomberg Reference Mappings** page you now have more flexibility and detail for delivery date mapping. You also have additional insight into the Bloomberg field names for pricing categories and date categories, for example **Date of Last Close (PX_CLOSE_DT)**. When you create or edit a mapping, you can use the new **Date Category** field to request market data delivery for specific rate dates.

For more information, see [Bloomberg Reference Mappings](#) and [Configure Third-Party API Integrations for Market Data Import](#).

Updated APIs for Market Data

You can now use PUT APIs to edit all market data types that already have POST (inbound) APIs. New PUT APIs are available for these market data types:

- **Marketdata - Commodity Rates**
- **Marketdata - Credit Spreads**
- **Marketdata - Fx Forward Rates**
- **Marketdata - Implied Fx Volatility**
- **Marketdata - Interest Volatility**
- **Marketdata - Security Prices**

Additionally, the **Provider** field is added to the existing PUT API for **Marketdata - Interest Rates**.

You access the API endpoints from Treasury Management with the **More options** button on the user toolbar, or from the Coupa Core Postman Collection for API.

For more information, see [Treasury APIs](#).

Introduction of Commodity Volatilities in new interface

You now have an updated **Commodity Volatilities** menu item in the new Treasury Management user interface, replacing the classic page. You can maintain and view commodity volatility data as before and view only the latest rate per commodity when you need it, consistent with the experience on all other market data menu items in the new interface. You also see the rate provider in a dedicated **Provider** column.

This change is a like-for-like functional replacement, so you can continue working with commodity volatilities in the same way you always have, but with the streamlined and expanded functionality of the new interface.

Release Note Changes

None.

Treasury Management Planning & Risk Enhancements

See the features for planning and risk added to Treasury Management for the May 2026 Release (R45).

Entity Group filter for Liquidity Planning Data

You can now filter according to **Entity Group** on the **Liquidity Planning Data** menu item. This enhancement aligns with existing functionality on menu items such as **Cash Flows** to further refine your workflows.

For more information, see [Liquidity Planning Data](#).

Release Note Changes

None.

Treasury Management Recon & Netting Enhancements

See the features for reconciliation and netting added to Treasury Management for the May 2026 Release (R45).

Enhanced Invoice Archive interface and integrations for Intercompany Reconciliation and Netting

You now have expanded integrations and a richer user interface to drive your automated intercompany (IC) netting reconciliation. On the **Invoice Archive**, improved logic now stores the settlement rate and amount calculations in your system database, which can be captured by outbound integrations for your enterprise resource planning (ERP) system. You benefit from an upgraded data model that aligns the classic IC netting flow, the **Invoice Archive**, and a richer, fully documented interface for automated reconciliation with your ERP.

The new archive logic is only available for data that is transferred to netting as of the May 2026 Release (R45). Now, when confirmed invoices are transferred to the invoice archive, the logic stores all records for netting item IDs, entity and counterparty settlement amounts, cross rates, reciprocal indicators, and the netting last-modified date and user. When these fields aren't available, for example for historical netting data, the system continues to use the previous on-the-fly calculation for settlement rates. The new logic doesn't store rates from invoices prior to the new release, but it preserves backward compatibility for your existing netting and reconciliation flows.

On the **Invoice Archive** data table, activate the new **Settlement Rate** selection to see the settlement rate and **Settlement Rate Reciprocal**, which capture cross-currency settlements between your IC entities and counterparties. Depending on whether the document is a receivable or payable, you now see the settlement rate and reciprocal indicator for either the entity or the counterparty. The system reads these values directly from the archive instead of recalculating them on the fly, so what you see onscreen matches exactly what your integrations export, eliminating the need to manually re-run calculations to book currency effects on an invoice.

The GET API **Netting - Recon Invoice Archive Classic** exports each invoice with the expanded netting and settlement attributes. You can now also capture the new attributes with the updated CSV integration **Standard Treasury Recon - Invoice Archive Export** using SFTP from the Core platform. The export description now has an additional field,

Netting item changed, which filters for invoice data that has changed within the last 15 days. This lets you filter and configure your integration for downstream ERP systems based on actual settlement data, and use the change timestamp to drive delta, "only-changed-since-last-run"

logic for extraction.

For more information, see [Invoice Archive](#) and [Treasury Integrations Overview](#).

Release Note Changes

None.

Supply Chain Design and Planning

See the features added to Supply Chain Design and Planning for the May 2026 Release (R45).

Supply Chain Design and Planning

See the features added to Supply Chain Design and Planning for the May 2026 Release (R45).

Supply Chain Home Page Enhancements

See the features added to the Supply Chain Home Page for the May 2026 Release (R45).

Data Flows

New Geocode action: Convert addresses into coordinates

The new Geocode action in Data Flows lets you convert address data into latitude and longitude directly on the Supply Chain Design & Planning platform. This eliminates the need to geocode locations in Data Guru and enables you to prepare location data for mapping, distance calculations, and cost-to-ship calculations as part of your standard data pipelines. Bing is used by default with no customer configuration required, and PC Miler is available for those who have subscriptions. Additional customer-configured providers are planned in the future.

The action allows you to map any combination of address components from your input table: Address, City, State/Province, Postal Code, Country. You can filter which records are geocoded using the Expression Builder. You can then define or reuse output columns for:

- Latitude (required)
- Longitude (required)
- Output Details (required; this new column provides success/failure information)
- Provider (optional, stores which provider was used)
- Match Info (optional, stores match quality returned by the provider)

When complete, the Geocode action results show how many records were successfully geocoded, how many were skipped, and why (for example, insufficient or invalid address data).

Note that the action only populates sites whose Latitudes and Longitudes are null or empty. If a site already has this information, it is not overwritten.

Common use cases

- Prepare shipment data for distance-based analysis
 - Geocode customer locations for shipments so you can calculate miles traveled, evaluate transportation cost per distance, and use these results in downstream distance or routing calculations.

- Build customer and site aggregations for modeling
 - Geocode granular location records, then aggregate them into customer and site structures for modeling scenarios in Modeler.
- Map networks and scenarios directly on the platform
 - Use the generated latitude and longitude fields to visualize customers, facilities, and flows on maps, without relying on external tools.
- Support app-driven workflows with geocoding
 - Include the Geocode action in Apps so that new or updated locations are automatically geocoded during data refreshes, keeping your location datasets map-ready over time.
- Reduce tool switching and manual pre-processing
 - Move geocoding from external desktop tools or Data Guru into Data Flows, reducing back-and-forth between technologies and centralizing your end-to-end supply chain data preparation on the platform.

New Unpivot action: Transform wide tables into long format

The new Unpivot action in Data Flows lets you quickly reshape wide tables (many measure columns) into long tables (fewer columns, more rows). This is useful when you need normalized data for analytics, visualizations, or loading into systems that expect attribute/value structures.

With Unpivot you can:

- Keep one or more fixed columns (keys like Product or Source)
- Drag and drop fields to map them as fixed columns or unpivot them to rows
- Use auto-mapping buttons to quickly populate fields based on your table structure
- Easily name your new “attribute” and “value” columns
- Choose to create a new output table or use an existing one, with options to clear or overwrite as needed.

The Unpivot action is available in the Build category on the Data Flows canvas. When you add it to your flow, you'll see all the relevant details at a glance, including input/output tables

and configuration status.

For example, if you have monthly sales data in a wide format:

Product	Jan	Feb	Mar
A	100	150	120
B	200	250	230

You would configure the Unpivot action to:

- Keep Product as a fixed column
- Unpivot Jan, Feb, Mar
- Name the new columns Month (attribute) and Sales (value)

The Unpivot action transforms the table to:

Product	Month	Sales
A	Jan	100
A	Feb	150
A	Mar	120
B	Jan	200
B	Feb	250
B	Mar	230

You can now more easily filter by month, build time-series charts, and integrate with tools that require long-format data.

New Model Options action: Set model options in Data Flows

The new Model Options action allows you to copy some or all of the settings from one Supply Chain model to another within a Data Flow, allowing you to tune the default options and settings of the model.

When copying only some options, you can configure model options with assignment-level

filters, and aggregation, allowing for precise control over how each option is set from source data or expressions. A new wizard-style selector allows users to browse and select model options by category and sub-option, reducing errors and speeding up configuration. Data review tooltips now include hyperlinks to both input and output options tables, making it easy to review affected options directly from the action panel or from execution history.

Example

For example, if you want to create a new model that covers the European Union, you might also want to use European measurements. By default, Modeler creates a model with U.S. measurements and currency. You could use the Model Option action to change the model's measurements settings to European settings (Euro, km, liters).

Updated Distance Calculation action

The Distance Calculation action in Data Flows now provides more flexibility on how distances are calculated. You can now choose to calculate distances using a service as a primary or secondary source. As a secondary source, this lets you use straight-line distance for longer lanes and a geocoding service (such as Bing or PC Miler) for shorter lanes below a threshold you define. These updates make it easier to manage distance logic directly in your data flows without manual pre-processing.

When using Bing, you can also now choose to force Distance Calculation to use non-ferry routes when possible using the **Avoid Ferry Route Calculation if Possible** option. This option only appears for the Bing geocoding provider.

New Expression Builder functions and parity with Data Guru

You can now use a broader set of Data Guru–equivalent functions in Data Flows to check for default values, empty, and zero values, and string pruning functions.

- **Default-value functions**

- These functions check whether one or more fields are at their *default* value:
 - For strings: empty string
 - For numbers: 0
 - For Booleans: false
- The new functions are: `IsDefaultAll`, `IsDefaultAny`, `IsNotDefaultAll`, `IsNotDefaultAny`, `IsNullOrDefaultAll`, `IsNullOrDefaultAny`, `IsNotNullOrDefaultAll`, and `IsNotNullOrDefaultAny`.

- **Empty-string functions**

- These functions check whether string fields are empty or not empty.
- The new functions are: `IsEmptyAll`, `IsEmptyAny`, `IsNotEmptyAll`, `IsNotEmptyAny`
- The existing null/empty functions are now aligned to accept strings only. These functions have been updated: `IsNullOrEmptyAll`, `IsNullOrEmptyAny`, `IsNotNullOrEmptyAll`, `IsNotNullOrEmptyAny`.

- **Zero-value functions**

- These functions check whether one or more fields are zero (or not zero). They treat zero consistently across supported types (for example, numeric 0 or string `"0"`).
- The new functions are: `IsZeroAll`, `IsZeroAny`, `IsNullOrZeroAll`, `IsNullOrZeroAny`, `IsNotZeroAll`, `IsNotZeroAny`, `IsNotNullOrZeroAll`, `IsNotNullOrZeroAny`.

- **Formatting and string-pruning functions**

- These functions help you clean up and format values used in Data Flows.
 - `NumberToFormattedString` – converts a number to a formatted string (for example, for display or export).
 - `PruneLeft` – removes characters from the left of a string (for example, strip leading codes or prefixes).
 - `PruneRight` – removes characters from the right of a string (for example, strip trailing codes or suffixes).

Release Note Changes

None.

Supply Chain Modeler Enhancements

See the features added to Supply Chain Modeler for the May 2026 Release (R45).

Model schema changes

A number of tables and columns are changed in the R45 (413000) model schema.

For the full set of schema changes, see [Model Database Schema Changes](#).

Platform support for model versions

The Supply Chain platform supports solving models with a database schema of up to one year old. As of the May 2026 Release (R45), this includes models from releases back to the R43 release (schema version 411000). You must update models with unsupported schemas before solving, modeling, using with apps, or solving on the cloud.

The following schema version and older model schemas are no longer supported:

- Release R42 (schema 410000)

Navi Modeling agent support for additional technologies

In addition to Network Optimization, the Navi modeling agent supports scenario analysis, comparison, and ranking for the following Problem Types:

- Greenfield Analysis (under the Network Optimization technology)
- Safety Stock Optimization (under the Inventory Optimization technology)
- Transportation Optimization (under the Transportation Optimization technology)

As with Network Optimization, you can prompt for information about both input and output data in the model. Response artifacts can include tables, charts, and plots.

Scenario Ranking updates

Scenario ranking has been extended to support metrics for Transportation Optimization, Inventory Optimization, and Greenfield Analysis. The Scenario KPI Weights table is populated with technology-specific KPIs. For example, Transportation Optimization offers Total Route Cost, Total Unrouted Shipments, and others; Inventory Optimization KPIs include Total Inventory Cost, Total Safety Stock Cost, and Average Service Level; Greenfield KPIs include Number of Facilities Opened and Percentage of Demand Served.

For each KPI you want to use, enter the relative Weight value and the Reference Value that each scenario's value will be compared against. Keep in mind that the weights of the KPIs are relative to each other and do not need to add up to 100. If the Weight is 0 for a KPI, that KPI is not considered in the composite score for the scenario. This is the value to which the KPI in all solved scenarios is compared. For example, you may decide to use the values in the existing Baseline scenario as your reference value.

If you have set the Technologies Mode to limit the table and column display to a subset of technologies, this is reflected in the Scenario KPI Weights table. With the Technologies Mode set to Transportation Optimization, only KPIs applicable to Transportation Optimization are displayed.

Scenario ranking output is also technology specific. There are individual output tables for each of the supported technologies:

- NO Scenario KPI Summary
- GF Scenario KPI Summary
- IO Scenario KPI Summary
- TO Scenario KPI Summary

Running scenarios from the Navi chat

When you have the Navi chat panel open in Modeler, you can ask Navi to run a scenario for you. Simply indicate the scenario you want to run and the problem type to be used to solve it. Use the @scenario identifier to display the list of scenario names for selection. For example, you can prompt:

Run Greenfield Analysis on the NorthEast_2025 scenario.

The solve is started and the response provides links to both the Scenario Queue in the Modeler Launch Pad and to the specific queue in the Queue Management Models tab where you can monitor the status of the solve.

The following are current limitations to using Navi to run the solve:

- One scenario per prompt is supported.
- The Rapid Solve problem type in Network Optimization is not currently supported.

Warm start Network Optimization solves

A Warm Start strategically utilizes the solution of a previously run scenario as a foundation to accelerate the processing time of a new scenario. This approach is highly effective because it

leverages the principle that scenarios with similar inputs, such as network structures, demand patterns, or cost parameters, frequently share near-identical optimal solutions. By "seeding" the solver with a known high-quality result, the system can bypass the exhaustive initial search phases typically required to find a feasible starting point.

The warm start workflow is completed in two steps. First, run the scenario you want to use as the base for the warm start using the Network Optimization problem type. When the "Store data for Rapid Solve and Warm Start" option is enabled, Network Optimization prepares and packages the underlying mathematical variables and solutions into a specialized, compressed format. This ensures that the data is fully compatible and can be seamlessly consumed by the warm-start solver in subsequent solves. This toggle on the General tab in Network Optimization Options is selected by default. Next, with the problem type still set to Network Optimization, select the Base scenario to use for the warm start, then select and run the scenario to use the warm start when solving. The solver performs a sophisticated mapping routine, attempting to align the variables and constraints of the base scenario with those of the new run. Once this alignment is complete, these matched values are used to initialize the search process, providing the solver with an advanced "initial guess" that guides it toward the new optimum more efficiently.

Choosing an appropriate base scenario is the most critical factor in determining the success of a Warm Start run. The ideal base scenario is a scenario that is nearly identical to the new model in terms of its structural constraints and objective functions. When these scenarios are closely aligned, the required computation time is often reduced significantly. Conversely, if the scenarios differ substantially, such as having a different network footprint or conflicting constraints, the solver may end up using an irrelevant starting point that can result in a longer total solve time than a standard "cold start" run.

When running Network Optimization using a base scenario (warm start), the WarmStart_Intensity parameter determines the extent to which decision variables are fixed. A lower value reduces the number of fixed variables and reduces the chance of infeasibility. The default value is 0, and changing this value can result in infeasibility. The WarmStart_Intensity parameter is located in the Config_NO input table.

Model decomposition options

For increasingly complex models, decomposition can improve performance using fast, iterative solves. The options to control NO Decomposition are located on the Model Reduction – Decomposition tab in the Network Optimization Options available from the Modeler Launch Pad. By default, decomposition is product-based and will use the Number of Decompositions option. For period-based decomposition, change the Decomposition Type to "Period Decomposition",

then set the Period Window Size and Period Window Move Step options. Both decomposition types use the Max Run Time Per Subproblem (secs) and Optimality Gap Per Subproblem (%) options.

For more information, see [Decomposition](#).

Model partitioning options location

For complex models, partitioning provides a way to break the model into smaller sub-problems based on periods, products, sites, demand, customers or lanes. Network Optimization then solves each sub-problem before determining the overall solution. The options used to control partitioning have been moved to the Model Reduction – Partitioning tab in the Network Optimization Options available from the Modeler Launch Pad.

Network Optimization work resource step usage

The Work Resource Step Summary output table provides visibility into how many work resources are used at each level based on step costs applied to the work resources.

Transportation Optimization sequential optimization

Sequential optimization lets you extend the TO optimization objectives beyond the traditional cost minimization. You can select additional objectives and assign priorities, tolerances, and weights to these objectives to control how they are handled during Transportation Optimization. Sequential optimization allows you to solve different objectives in a number of hierarchies. When prioritizing objectives, each priority value defines a group of one or more objectives that are then solved together.

The TO Sequential Objectives input table provides the set of objectives, such as Minimize Total Cost, Maximize EV Utilization, and Minimize Earliest Delivery Deviation. Objectives with the same Priority value are grouped together when solved, with those having lower Priority values being solved first. The Weight is used to control the relative values between objectives. The Tolerance acts as a maximum for the deviation of a value from its original value. Sequential optimization requires multiple runs of route selection with different objectives, and this can impact run time.

- **Priority** : Priority determines an objective group. Each group is solved together. All objectives with Priority 1 are grouped together and solved. Next all objectives with Priority 2 are grouped together and solved, and so on. Default : 1
- **Tolerance** : The tolerance specifies the amount of deviation in the objective value when solving the next hierarchy. For example, assume “Minimize Total Cost” is Priority 1 and has

a Tolerance of 0.1 and “Minimize Number of Unrouted Shipments” has Priority 2. The solver first minimizes total cost and then minimizes number of unrouted shipments such that the new value of “Minimize total cost” does not deviate more than 10% from the value when the Priority 1 objective was solved. Default : 0.10

- **Weight :** This is a weight applied to the objective function. For objectives with the same priority, different objective weights can be considered to either normalize them or encourage the solver to prioritize one objective over another at the same level. For example, a model has a Fixed CO2 emission of 5000 and the “Minimize Co2 Emission” objective has a Weight of 2 defined. This will be treated as an emission value of 10000. Default :1

Electric vehicles options in Transportation Optimization

Electric vehicles inherently come with the complexity of downtime due to potentially long charge-times. Transportation Optimization offers options to optimize downtime and increase asset utilization. The various options to control behaviors for electric vehicles are located on the Electric Vehicles tab in the Transportation Optimization Options available in the Modeler Launch Pad. These options control behaviors such as whether you require vehicles to be charged to full capacity and if deferred charging is supported between routes:

- Optimize EV charging amount to efficiently reach the next station
- Eliminate EV full capacity charging requirement at the end of the route
- Simultaneously charge EVs during the driver's short breaks
- Consider not only distance but also charging costs when picking charging stations

Simulation enhancements

Various improvements have been made to Simulation including the following:

- Transportation Processes are supported through use of the following input tables: Transportation Processes, Transportation Process Steps, and Transportation Process Assignments.
- Business Hours applied to Work Centers are respected when determining production transactions.
- The Process Summary output table reports the Policy Type and Process Type. Additionally, the Total Process Cost is reported rather than Production Cost.
- Production supports infinite occurrences. When Occurrences is set to INF in the Production

table, production recurs until the end of the model horizon.

Duplicating rows in input tables

In Modeler input tables, including user defined tables, you can select a row and duplicate it. Select the row you want to duplicate, then select Duplicate Row to create a copy of the existing row. If the selected row has warnings about invalid values, you will be prompted to confirm the duplicate action. If unique values are required, such as a site Name, you must enter these to create a valid record. All non-unique values are copied into the new record. You can then enter or edit values as needed to complete the record.

Release Note Changes

None.

Supply Chain Prescriptions

See the features added to Supply Chain Prescriptions for the May 2026 Release (R45).

More accurate transportation cost prescriptions using rate cards

Supply Chain Prescriptions now estimates transportation costs by incorporating your latest rate card data from the Zone Cost Definitions, Zone Assignments, and Zone Costs tables in Supply Chain Modeler. This provides support for more complex pricing, including:

- Slab / tier-based rates that change with shipment volume or weight
- Contract-specific surcharges and fees

This update provides more accurate cost prescriptions that better reflect your real, contracted transportation rates. It also provides improved savings estimates for Prescriptions projects that rely on zoning and modeled transport costs. This enhancement is available if you are using the zoning framework from Supply Chain Modeler.

Release Note Changes

None.

Supply Chain Guru X Enhancements

See the features added to Supply Chain Guru X for the May 2026 Release (R45).

Model schema changes

A number of tables and columns are changed in the R45 (413000) model schema.

For the full set of schema changes, see [Model Database Schema Changes](#).

Platform support for model versions

The Supply Chain platform supports solving models with a database schema of up to one year old. As of the May 2026 Release (R45), this includes models from releases back to the R43 release (schema version 411000). You must update models with unsupported schemas before solving, modeling, using with apps, or solving on the cloud.

The following schema version and older model schemas are no longer supported:

- Release R42 (schema 410000)

Network Optimization work resource step usage

The Work Resource Step Summary output table provides visibility into how many work resources are used at each level based on step costs applied to the work resources.

Simulation enhancements

Various improvements have been made to Simulation including the following:

- Transportation Processes are supported through use of the following input tables: Transportation Processes, Transportation Process Steps, and Transportation Process Assignments.
- Business Hours applied to Work Centers are respected when determining production transactions.
- The Process Summary output table reports the Policy Type and Process Type. Additionally, the Total Process Cost is reported rather than Production Cost.
- Production supports infinite occurrences. When Occurrences is set to INF in the Production table, production recurs until the end of the model horizon.

Release Note Changes

None.

Data Guru Enhancements

See the features added to Data Guru for the May 2026 Release (R45).

Improved model filters in the Platform Table Import action

The Platform Table Import action supports filters across multiple columns and values. When the source data is a model, you can use both the AND and OR operators to define the filter criteria. This behavior was already supported for UDDBs and DDMs.

Release Note Changes

None.

Model Database Schema Changes

This topic lists the Supply Chain model database schema changes for the May 2026 Release (R45).

Input tables

Review columns that have a Description of Change value of "Data Type change", "Column removed", or "Change in Required". If you use these columns in a workflow, you may need to adjust the workflow to support the new data type or requirement.

Table	Column	Description of Change	Model Database Table	Model Database Column	Data Type	Required
Scenario KPI Weights	Technology Type	New column	ScenarioKPI-Weights	TechnologyType	Text	Yes
NO Sequential Objectives	N/A	Renamed table from Sequential Objectives	SequentialObjectives	N/A	N/A	N/A
TO Sequential Objectives	Objective Name	New table/column	TOSequentialObjectives	ObjectiveName	Text	Yes
TO Sequential Objectives	Priority	New table/column	TOSequentialObjectives	Integer	Yes	Yes
TO Sequential Objectives	Tolerance	New table/column	TOSequentialObjectives	Tolerance	Float	Yes

Table	Column	Description of Change	Model Database Table	Model Database Column	Data Type	Required
TO Sequential Objectives	Weight	New table/column	TOSequentialObjectives	Weight	Float	Yes
TO Sequential Objectives	Status	New table/column	TOSequentialObjectives	Status	Text	No

Output tables

Review columns that have a Description of Change value of "Data Type change", "Column removed", or "Change in Required". If you use these columns in a workflow, you may need to adjust the workflow to support the new data type or requirement.

Table	Column	Description of Change	Model Database Table	Model Database Column	Data Type
NO Scenario KPI Summary	N/A	Renamed table from Scenario KPI Summary	ScenarioKPISummary	N/A	N/A
TO Scenario KPI Summary	KPI Name	New table/column	TOScenarioKPISummary	KPIName	Text
TO Scenario KPI Summary	KPI Number	New table/column	TOScenarioKPISummary	KPINumber	Integer

Table	Column	Description of Change	Model Database Table	Model Database Column	Data Type

Model option changes

Supply Chain Guru X users: If you previously used parameters in Config_TO or Config_NO and these have been moved to the Options table, you must add them back to the appropriate Config table to control their values in the application UI. For example, if you had PeriodWindowSize set to 3 for Period Decomposition and want to change the value to 2, create a new record in the Config_NO table. The Parameter Name is PeriodWindowSize, the Parameter Value is 2, and the Status is Include.

Option	Change	Details
Charge EV To Full	New TO option (moved from Config_TO to Options)	Available in Transportation Optimization Options in Modeler. For SCGX, add the ChargeToFull parameter to the Config_TO table. One of False (default) or True.
Allow Deferred Charging Between Routes	New TO option (moved from Config_TO to Options)	Available in Transportation Optimization Options in Modeler. For SCGX, add the AllowDeferredChargingBetweenRoutes parameter to the Config_TO table.

Option	Change	Details
		One of False (default) or True.
Use Both Distance And Cost For Charging Station Selection	New TO option (moved from Config_TO to Options)	Available in Transportation Optimization Options in Modeler. For SCGX, add the UseBothDistanceAndCostForChargingStationSelection parameter to the Config_TO table. One of False (default) or True.
Simultaneous Short Break And Charging	New TO option (moved from Config_TO to Options)	Available in Transportation Optimization Options in Modeler. For SCGX, add the SimultaneousShortBreakAndCharging parameter to the Config_TO table. One of False (default) or True.
Min Charge Time To Short Break Ratio To Enforce Short Break	New TO option (moved from Config_TO to Options)	Available in Transportation Optimization Options in Modeler. For SCGX, add the MinChargeTimeToShortBreakRatioToEnforceShortBreak parameter to the Config_TO table. Default is 0.25.
Decomposition Type	New NO option (moved from Config_NO to Op-	Available in the Network Optimization Options in

Option	Change	Details
	tions)	Modeler. Default is Product Decomposition. In SCGX, add the PeriodDecomposition parameter to the Config_NO table. To turn off Period Decomposition using Config_NO, set the PeriodDecomposition parameter to 0.
Number of periods per window	New NO option (moved from Config_NO to Options)	Available in the Network Optimization Options in Modeler. For SCGX, add the PeriodWindowSize parameter to the Config_NO table. Default is 1.
Window step size (in Periods)	New NO option (moved from Config_NO to Options)	Available in the Network Optimization Options in Modeler. For SCGX, add the PeriodWindow-MoveStep parameter to the Config_NO table. Default is 1.
Optimization Objectives	New TO option	This is one of Minimize Costs (default) or Sequential Optimization. For SCGX, you can control the TO Optimization Objective using a Scenario Item.

Option	Change	Details
WarmStart_Intensity	New NO option in Config_NO table	Higher warm start Intensity levels lock down more variables, reducing the complexity of the solution space leading to quicker results by prioritizing efficiency over flexibility. Configuring intensity higher than default (0) may result in infeasibility. Default is 0.
Diagnose Model Structure	Change in default	For new models, this NO Infeasibility Diagnosis option is not selected by default.
Use Customer Cluster Radius	Change in default	For new models, this NO Greenfield Analysis option is selected by default.
Max Run Time Per Partition (secs)	Renamed	This NO Advanced model option for Partitioning was previously called Max Run Time Per Subproblem (secs).
Optimality Gap Per Partition (%)	Renamed	This NO Advanced model option for Partitioning was previously called Optimality Gap Per Subproblem (%).

Supply Chain Collaboration

See the features added to Supply Chain Collaboration for the May 2026 Release (R45).

Purchase Order Collaboration

See the features added to Purchase Order Collaboration for the May 2026 Release (R45).

Collaborate on Order Line Subcontracting Components

Work together with your suppliers to manage and confirm subcontracting components on order lines.

Manage subcontracting lines and their components on purchase orders. Collaborate with suppliers to confirm and acknowledge the components used for production before it begins.

To enable subcontracting capabilities for a specific line, set the `is-subcontracting` flag to true in the order line payload. Each subcontract line includes components that the supplier uses as raw materials. You can:

- Specify core component attributes.
- Add attachments and notes.
- View subcontracting details on orders.

The purchase order page includes a **Subcontract** field to indicate if subcontracting is enabled for a line. It also includes a **Components** field that displays the total count of components for that line. Select the number to open a view containing all line components and their attributes, such as notes, attachments, and confirmation status.

The order confirmation page, provides immediate insight into subcontracting confirmation progress:

- The main order confirmation banner includes a tile that displays a count of components requiring action. Select the count to view the filtered list of these items.
- The **Lines** data table includes new columns to provide immediate visibility into subcontracting details:
 - **Subcontract**: Indicates if subcontracting is enabled for the line.
 - **Components**: Indicates the total count of components associated with the line. Select the total count to open an overlay with the list components, their specific details, and available actions according to the component status.
 - **Components Status**: Shows an aggregated confirmation state for all the components associated to the line.

#	Component	Status	External ID	Description	Quantity	UOM	Notes	Attachment	Supplier Reason	Supplier Reason Detail	Actions
1	Steel Rod	Confirmed	COMP-001	10mm steel rod	500	Each		Have-a-Good-Day-Words.jpeg	None	None	
2	Steel Rod	Supplier Cannot Use	COMP-002	10mm steel rod	500	Each		Have-a-Good-Day-Words.jpeg	Cannot use	None	
3	Steel Rod	Supplier Proposed Changes	COMP-003	10mm steel rod	50 500	Each		Have-a-Good-Day-Words.jpeg	Replaced by a newer model/part	None	
4	Steel Rod	Pending Confirmation	COMP-004	10mm steel rod	500	Each		Have-a-Good-Day-Words.jpeg	None	None	
5	Steel Rod	Pending Confirmation	COMP-005	10mm steel rod	500	Each		Have-a-Good-Day-Words.jpeg	None	None	

Suppliers can accept, reject, or propose changes for individual components, which you can then review to accept or reject. Component statuses update automatically based on these actions. Component and order line confirmation statuses are independent, so updating a component status doesn't affect the parent order line confirmation status.

NOTE:

Outbound cXML and **Act on Behalf of Supplier** are not yet supported for this feature.

Order Confirmation cXML Errors Visible on CSP

Suppliers can track cXML Order Confirmations stuck in transmission.

Suppliers can manage cXML transmission errors related to Order Confirmations directly within the **cXML Errors** section of the Coupa Supplier Portal (CSP). This feature provides suppliers with self-managed access to track and resolve issues when sending Order Confirmations through cXML.

Suppliers can navigate to **Setup**→**cXML Errors**. In the **Order Confirmation** tab, they view a unified list of transmission errors for all their customers. The data table includes:

- **Purchase Order #**: Displays the reference number for the order associated with the error.
- **Error Date**: Shows the specific date and time the transmission failed.
- **Error Type**: Describes the nature of the failure, such as the request failing to validate against the Document Type Definition (DTD).
- **Request**: Select **View Request** to inspect the cXML data sent by the supplier.
- **Error Response**: Select **View Response** to see the error message returned during the transmission attempt.

Suppliers can see the **Advanced** search to filter error logs by **Error Type**, **Error Date**, or **Purchase Order #** to locate specific transmission failures. For more complex monitoring needs, they can select **Add View** to create and save personalized data table configurations based on specific error conditions or supplier requirements.

Forecast Collaboration

See the features added to Forecast Collaboration for the May 2026 Release (R45).

Add Comments to Forecast Lines

Use comments to communicate with suppliers or internal users in Forecast Collaboration.

Forecast Collaboration helps you communicate with your suppliers and the users in your organization through line-level comments as you work to confirm your forecast. To access the comment window, navigate to **Forecast**, open one of your forecast, hover over a forecast line, and select the **Add Comments** icon.

In the comment window, you can:

- Select **Supplier** or **Internal** as recipient.
- Tag internal users.
- Add attachments.
- Mute or unmute comments.
- Edit or delete comments you posted.
- View read receipts with timestamps.

Suppliers and tagged internal users receive an email notification with each comment. Similarly, you receive a notification every time a supplier adds or replies to a comment. Each notification includes the forecast number, the comment content, and a link to the specific forecast.

Unread comments display a red bubble indicating the count. To review comments, select the comment icons with red notification bubbles on them. You can see the comments left for you

and reply to them.

For more information, see [Add Line-Level Comments to Forecast](#).

Quality Collaboration

See the features added to Quality Collaboration for the May 2026 Release (R45).

Quality Collaboration Enhancements

Changes and enhancements to improve the Quality Collaboration experience. With these updates to the buyer and supplier views, you can better track, manage, and communicate about quality inspections.

Feature availability

Quality Collaboration transitions from Early Access Program (EAP) to General Availability (GA).

Navigation to external purchase orders

If a purchase order (PO) is available in Coupa, you can navigate to it from the **Document Reference** column in the Inspections table or from the **Quality Inspection** header details. Select the Document Reference value to access the specific PO page.

Results column color identifiers

To help you identify if inspections results meet your requirements, the buyer's view includes color-coded tags in the **Results** column:

- Red: The result is completely out of range and does not match the expected value.
- Yellow: The result is within the standard range but does not match the exact expected value.
- No color: The result matches the expected value.

Supplier data entry improvements

To ensure all the necessary information is provided, the **Result** field for suppliers now displays a **Required** watermark. This informs suppliers which characteristics require input before they can submit the inspection.

Organized inspection views

To prioritize the most relevant information, the **All Inspections Request** table is now sorted in descending order by default. This allows you to see the latest quality inspections at the top of the list.

For more information, see [Collaborate on Quality Inspections](#).

Roles and permissions

None.

Integrations

Discover Suppliers with the Sourcing Supplier Recommendations Agent

Identify and shortlist relevant suppliers for your sourcing events based on category, region, and past performance, using the Sourcing Supplier Recommendation agent through the Coupa Navi™ (Navi) chat.

Identifying the right suppliers to invite to a sourcing event often requires manual searches across multiple systems, which delays the sourcing process and limits competition. Use the Sourcing Supplier Recommendation Agent to automatically identify and invite the best suppliers for your event.

Access the agent through the Navi panel during or after you create an event. When you ask the agent to recommend suppliers for your event, the agent analyzes the event details, such as the category, region, and value, to find the best matches. The agent searches your existing suppliers and the broader community to generate a ranked list of the top recommendations.

The agent evaluates suppliers based on past performance, category experience, risk factors,

and diversity and sustainability alignments. For each recommended supplier, view a summary of their qualifications, status, and contact details. Ask follow-up questions to refine the search, request additional recommendations, or change your search filters.

After you review the recommendations, select the desired suppliers and ask the agent to add them directly to your event. The agent automatically filters out suppliers that are already included in the event to prevent duplicates.

NOTE:

The agent has limited supplier filtering capabilities and configurable recommendation sources. Include specific event context in your request to ensure accurate recommendations.

Roles and permissions

None.

Integrations

Skill Enhancements to the Supplier Response Comparison Agent

Use the Supplier Response Comparison Agent to evaluate bids based on supplier profile criteria, evaluator analysis, and offline attachments.

Accelerate your award decisions getting insights from Coupa Navi into supplier risk, sustainability, diversity, and evaluator scores.

Evaluating supplier bids requires analyzing both quantitative data and qualitative feedback from multiple stakeholders. Optimize your award process using the new skills added to the Supplier Response Comparison Agent.

Skill enhancements to the Supplier Response Comparison Agent include:

- Compare offline attachments: Upload offline supplier documents, such as pricing matrices or compliance certificates, and ask the agent to summarize the contents. Ask the agent to compare specific attachments from multiple suppliers.

NOTE: Follow-up questions for uploaded attachments are not supported.

- Filter by supplier profile criteria: Ask the agent to filter and compare suppliers based on risk scores, sustainability information, diversity status, and custom fields. For example, ask the agent to "Show me the best suppliers for this event excluding suppliers with high risk" or "Which diverse supplier should I prefer?"
- Analyze evaluations: View top-scored suppliers and generate an analysis of how different evaluators scored the responses, including the comments they provided.

NOTE:

You must have the required access permissions to view specific supplier profile criteria, such as risk or diversity data, to use this data in your agent evaluations.

For more information, see [Summarize Sourcing Bids with Supplier Response Comparison Agent](#).

Evaluate Sourcing Events with the Comparative Bid Report

View a centralized, comparative summary of bids, evaluations, and supplier risk across an event and its follow-on chain. Eliminate manual data collection and accelerate your award analysis and approval decisions.

Evaluating bids across multiple events and tabs requires manual data consolidation. You can optimize this process using the **Bid Summary** tab on sourcing events.

SettingsTimelineDetailsSuppliersEvaluationsAwardResponsesMessagesBid Summary

Awards

Event	Supplier	Awarded Amount	Allocation % of Event
Sourcing Event #4763 - Computer equipment template	sayali_qe8_supp2	100.00 USD	100 %

Comparative Bid Report

Supplier	Total Bid Price	Savings vs Baseline	Savings vs Benchmark Event
	Sourcing Event #4763 - Computer equipment template ★	Sourcing Event #4763 - Computer equipment template ★	Sourcing Event #4763 - Computer equipment template ★
sayali_qe8_supp2	100.00 USD	-100.00 USD	-100.00 USD

The application automatically generates a comprehensive comparative report that aggregates data from the current event and any linked follow-on events. This single-page view consolidates crucial decision-making data, which simplifies the evaluation process and improves audit readiness by providing a clear rationale for award decisions.

Summary Report

☒ Award Section

☒ Comparative Bid Report

☒ Total Bid Price

☒ Savings vs Baseline

☒ Savings vs Benchmark Event

According to the selected fields on the configuration, you can see the following information on the **Bid Summary** tab:

- Awards: View awarded suppliers, allocated amounts, and allocation percentages.
- Comparative Bid Report: Compare total bid prices and base prices against a selected benchmark event to calculate savings.
- Event Level Standard and Custom Fields: Review key event data such as planned savings, cost avoidance, and shipping terms.
- Technical and Commercial Evaluation Data: Compare overall and section-level evaluation scores.
- Supplier Risk and Disqualified Suppliers: Review supplier risk assessments and disqualification reasons.
- Data from Panel Apps: Access third-party integration data directly within the summary.
- Customize the report layout and content in your sourcing settings. Select which sections and specific fields appear on the **Bid Summary** tab to focus on the most relevant data for your organization.

NOTE:

The **Bid Summary** tab displays data after an event ends and suppliers submit their responses.

Leverage the New Line-Level Standard Tax Details in Sourcing

Capture line-level tax details explicitly in sourcing events without exceeding your custom field limits. Use dedicated tax codes and rates to improve synergy with downstream purchasing processes.

Capture line-level tax details using standard tax fields that align with the tax rate types and tax codes used in requisitions and invoices. When you enable this feature, you see a **Tax Details** option on sourcing event lines.

Select one or more tax codes, and the application auto-populates the corresponding tax rates. You can add the tax codes to all the lines or to the selected line only. The total bid price includes all specified taxes to equalize comparisons across different regions.

Add Tax Details

Line No	Tax Code	Tax Rate	Actions
	Tax Code UKRED - United Kingdom (5%) UKZER - United Kingdom (0%) MXSTA - Mexico (16%) MXRED - Mexico (8%) MXZER - Mexico (0%) HSTT - undefined (30%) Standard Rate - United Kingdom	0	

+ Add Tax Line

Save for all lines

Save for lines in lot

Save

Allow suppliers to modify tax codes and rates. When the setting is enabled, suppliers view the tax codes that you set up, modify the rates, and add new tax codes from your master data before they submit their responses.

Tax details flow seamlessly across the procurement process. When you create a sourcing event from a requisition, the tax codes and rates copy to the sourcing line. When you award an event and create or update a requisition, the tax details and calculated tax amounts transfer back to the requisition line.

NOTE:

Use field settings to control the visibility and editability of tax fields for buyers and suppliers.

Coupa Sourcing Optimization

See the features added to Coupa Sourcing Optimization for the May 2026 Release (R45).

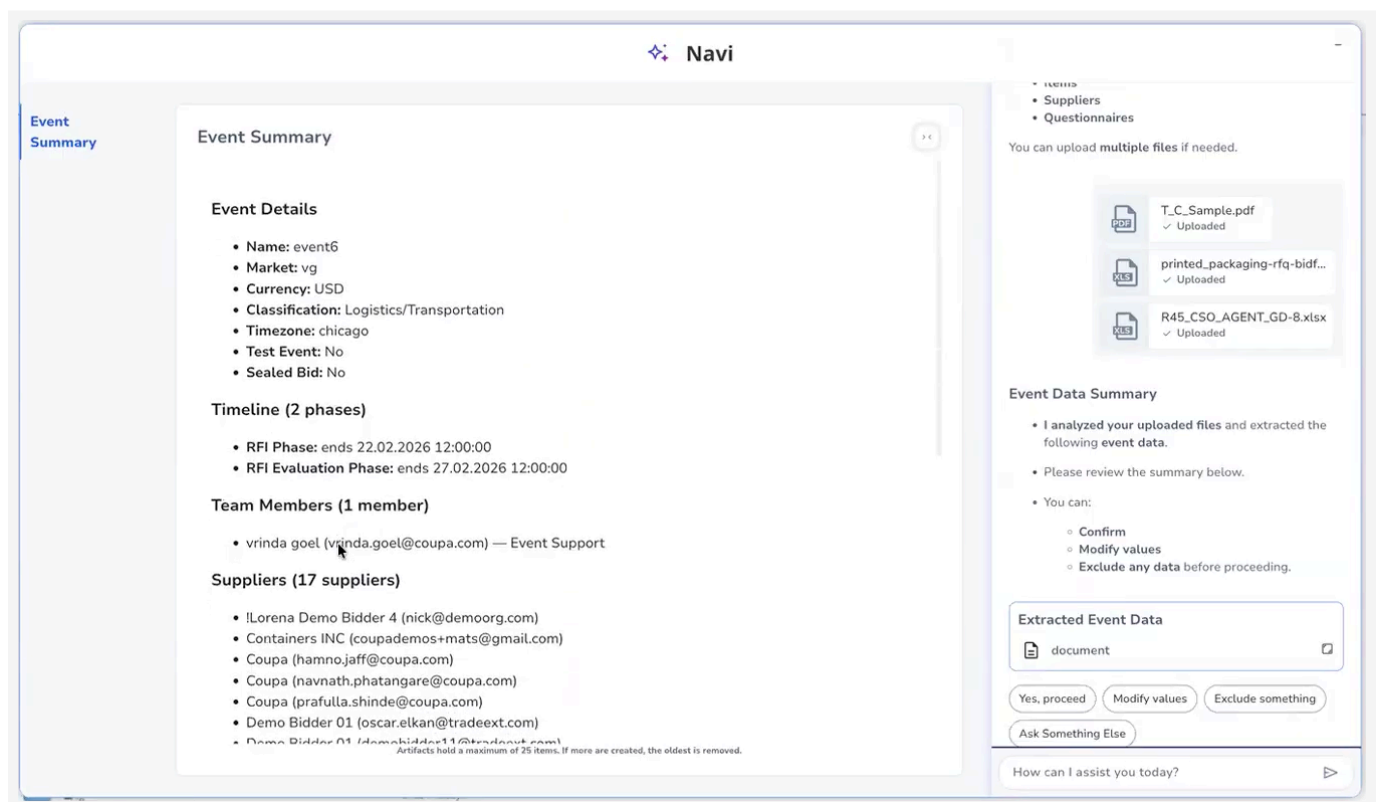

File Upload Enhancements to the Sourcing Optimization Event Creation Agent

Accelerate your Sourcing Optimization event setup uploading files to create events with the Sourcing Optimization Event Creation Agent. Upload Excel files directly into Coupa Navi™ (Navi) to automatically extract data and configure your sourcing optimization events, minimizing manual entry and reducing setup errors.

Upload your sourcing data and let Navi guide you through the event creation process. Use the following capabilities to configure your events:

- **Intelligent file parsing:** Upload one or multiple Excel files (up to five files, maximum 25 MB each) containing your event data. Each Excel file can contain multiple tabs, and your event information can be consolidated on a single tab or spread across multiple tabs. Navi analyzes the content to detect event details, timelines, team members, suppliers, items, and questionnaires. You can upload PDF files with unstructured text, such as Terms and Conditions or informational documents, Navi extracts and analyzes the unstructured text from the PDFs.
- **Interactive data review:** Review a clear summary of the extracted data within the Navi chat. Navi explains its findings and asks clarifying questions, such as asking you to identify the correct bid form. If any mandatory information is missing, such as the event currency or time zone, Navi prompts you to provide it.
- **Flexible data control:** Confirm, modify, or exclude specific data points before creating the event. For example, instruct Navi to skip importing suppliers during creation and add them later.
- **Automated configuration:** After you confirm the details, Navi automatically creates the event and populates the data. Navigate to the Event Details, Timeline, Team, Suppliers, and Items tabs to review the imported data. Navi also converts unstructured text into PDF documents and adds them directly to the event.

Roles and permissions

- [Updated system roles](#): Administrator, Market Manager, Event Manager, Owner, Event Support.

Guided Orchestration Now Generally Available With More Enhancements

Guided Orchestration (GO) is now generally available, bringing you intelligent file imports, granular item access controls, historical data, and an interactive formula editor to accelerate event setup.

The Coupa Sourcing Optimization (CSO) Guided Orchestration experience provides a simplified, step-by-step workflow that makes it easy to configure and manage complex sourcing events without needing expert knowledge. For more information, see [Create and Launch Sourcing Events with Guided Orchestration](#).

The screenshot shows the 'Test event from template' window in the Coupa system. On the left is a vertical navigation menu with steps: Event Details, Event Team, Timeline, Suppliers, Supplier Prerequisites, Items (selected), Items Setup, Supplier Input, Cost Formula, Advanced Settings (Optional), Questionnaires, and Supplier Invitation. The main area is titled 'Cost Formula' and includes a sub-header 'The cost formula ensures supplier bid prices can be calculated for each item.' Below this is a form for 'Item Type' with a dropdown menu set to 'Dresses and Skirts'. Underneath are tabs for 'Function', 'Fields', and 'Operators'. A list shows '1 NaN'. Instructions below the list state: 'Press Ctrl + Space (or Option + Z on Mac) to activate autocompletion for field names. Press Ctrl + Shift + Space to activate autocompletion for functions and constants.' At the bottom right of the form are 'Cancel' and 'Save' buttons. At the bottom of the main area are 'Back' and 'Next' navigation buttons. A 'Switch to Classic Experience' button is in the top right corner.

To create sourcing optimization events, the following existing functionalities have been introduced to the CSO GO experience:

- **Smart Import:** create questionnaires, items, and suppliers from Excel files. Answer clarifying questions during the upload, such as identifying input cells, to ensure your data maps correctly. You can also associate imported questionnaires directly with tasks. Access this feature by selecting **Smart Import** from the **Import** menu on the **Items**, **Suppliers**, or **Questionnaires** pages.
- **Item Access:** Control item visibility and bidding access for specific users and groups. You can restrict access for suppliers, observers, event support, and custom user groups by uploading an item access matrix or by setting item restriction fields. Find these options on

the **Event Details** tab within the **Advanced Settings** page of the **Items** step.

- **Historical Data:** Benchmark prices and track incumbent suppliers to improve your negotiation outcomes. You can define detailed historic data per supplier and item using incumbent price, cost, and quantity fields. Alternatively, you can establish a simpler baseline per item. Configure these benchmarks on the **Historical Data** tab within the **Advanced Settings** page of the **Items** step.
- **Formula Editor:** Build and modify formulas using the new interactive editor. Insert fields, functions, and logical operators directly from searchable dropdown menus, or use keyboard shortcuts to trigger the autocomplete functionality. This editor is available wherever you configure formulas, such as on the **Cost Formula** page, and contains context-aware visual aids, member lists, and quick information.
- **Commodity Codes:** Select customer-defined commodity codes when you create an event. Choose a commodity on the **Event Details** step to automatically map the corresponding Coupa Classification. This ensures your sourcing events align with your organization's specific taxonomy. The system now uses the commodity attribute to define the item type instead of the Coupa Classification.

 **NOTE:** CSO GO does not support fact sheets.

Roles and permissions

None.

Integrations

None.

Availability

These features are included with Coupa Sourcing Optimization. Guided Orchestration is now generally available and on by default.

Release Note Changes

None.

Integrate Sourcing Optimization Events With Coupa Category Strategy

Link your strategic initiatives in Coupa Category Strategy (CCS) directly to Coupa Sourcing Optimization (CSO) events. Track sourcing events directly from your CCS initiative and sync key data between the two systems.

Create a CSO event directly from a strategic initiative in CCS. The workflow depends on your user role permissions:

- Users with Sourcing Optimization Manager role: The application redirects you to CSO Guided Orchestration. Link an existing event or create a new event from scratch, from a template, from an existing event, or from an archive.
- Users without Sourcing Optimization Manager role: Link a CSO event from the CCS initiative. The application creates a request object in the CSO **Data Exchange** page for a manager to review and create the event.

NOTE: This feature requires a license for Coupa Core, Coupa Category Strategy, and Coupa Sourcing Optimization. Additionally, this integration requires the Guided Orchestration interface. You cannot disable Guided Orchestration if you want to use the integration between CCS and CSO.

Data from CCS to CSO

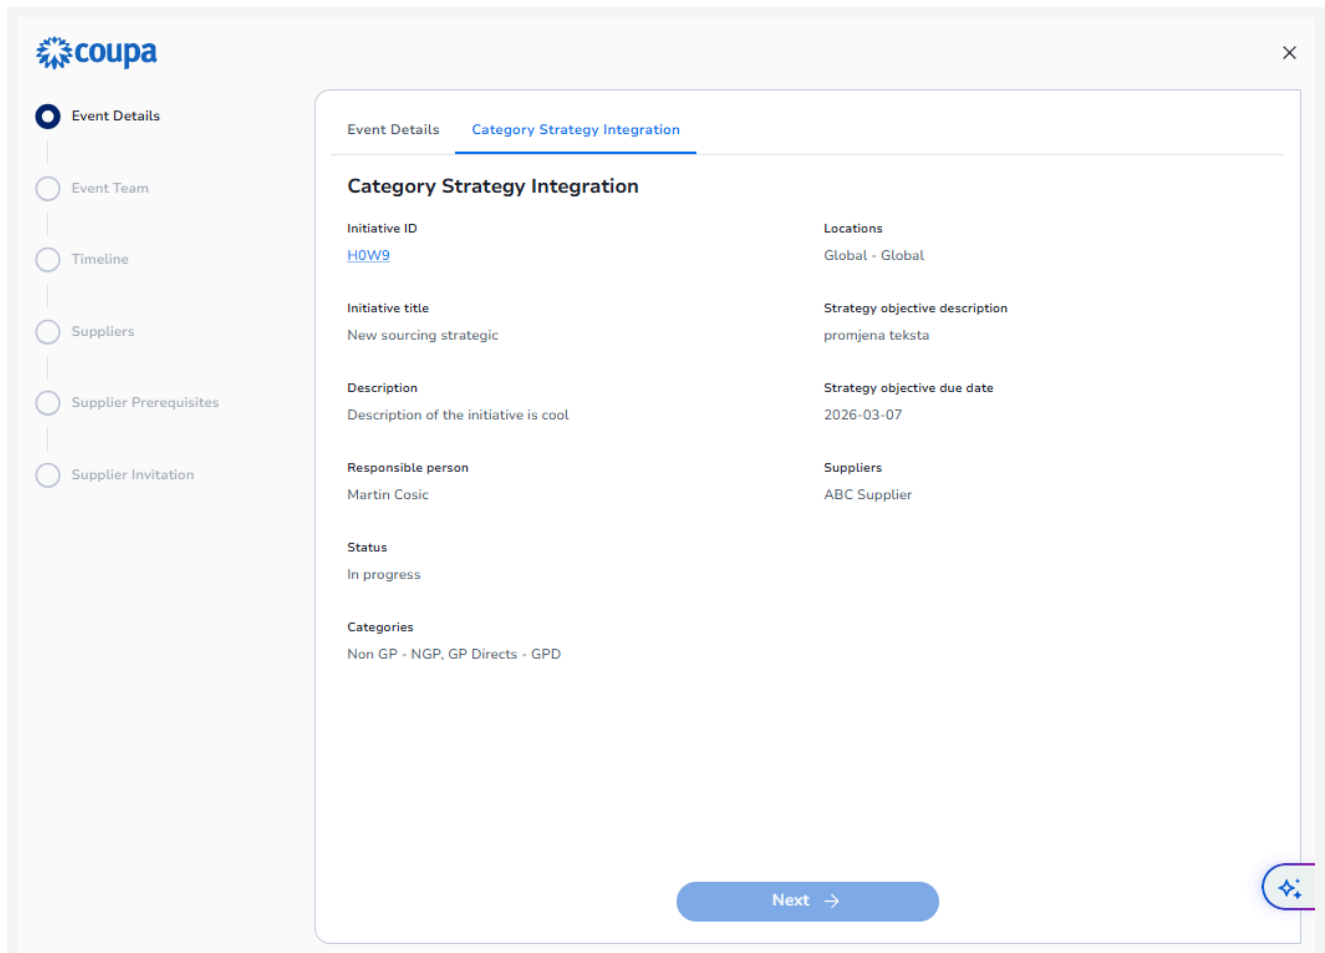

When you create a CSO event from a CCS strategy, you can see:

- A new **Category Strategy Information** tab on the **Event Details** step.
- A new **Category Strategy Information** section on the **Event Insights** page.

The new tab or section includes the following information:

- Initiative ID as a link to navigate to the strategy
- Initiative title
- Responsible person
- Status
- Categories
- Locations

- Initiative description
- Strategy objective description
- Strategy due date
- Suppliers
- Planned savings
- Currency

This shared data helps sourcing teams make context-aware decisions.

Data from CSO to CCS

In the CCS initiative, view the linked CSO event on the **Sourcing** tab. This tab displays event data sent back to the CCS initiative for near real-time visibility into the event's progress. The synchronized data includes:

- Sourcing system

- Event ID
- Event name
- Event creator
- Created on date and start date of the current phase
- Active phase
- Status
- Commodity
- Negotiated savings

This persistent connection applies to all follow-on events. View sourcing event details within your CCS initiative, and view CCS initiative details within your CSO event.

Roles and permission

- [Updated system roles](#): Sourcing Optimization Manager.

Integrations

None.

Availability

This feature is included with Coupa Category Strategy and Coupa Sourcing Optimization. It is off by default and configurable.

Release Note Changes

None.

Send Instant Messages in Sourcing Optimization Events

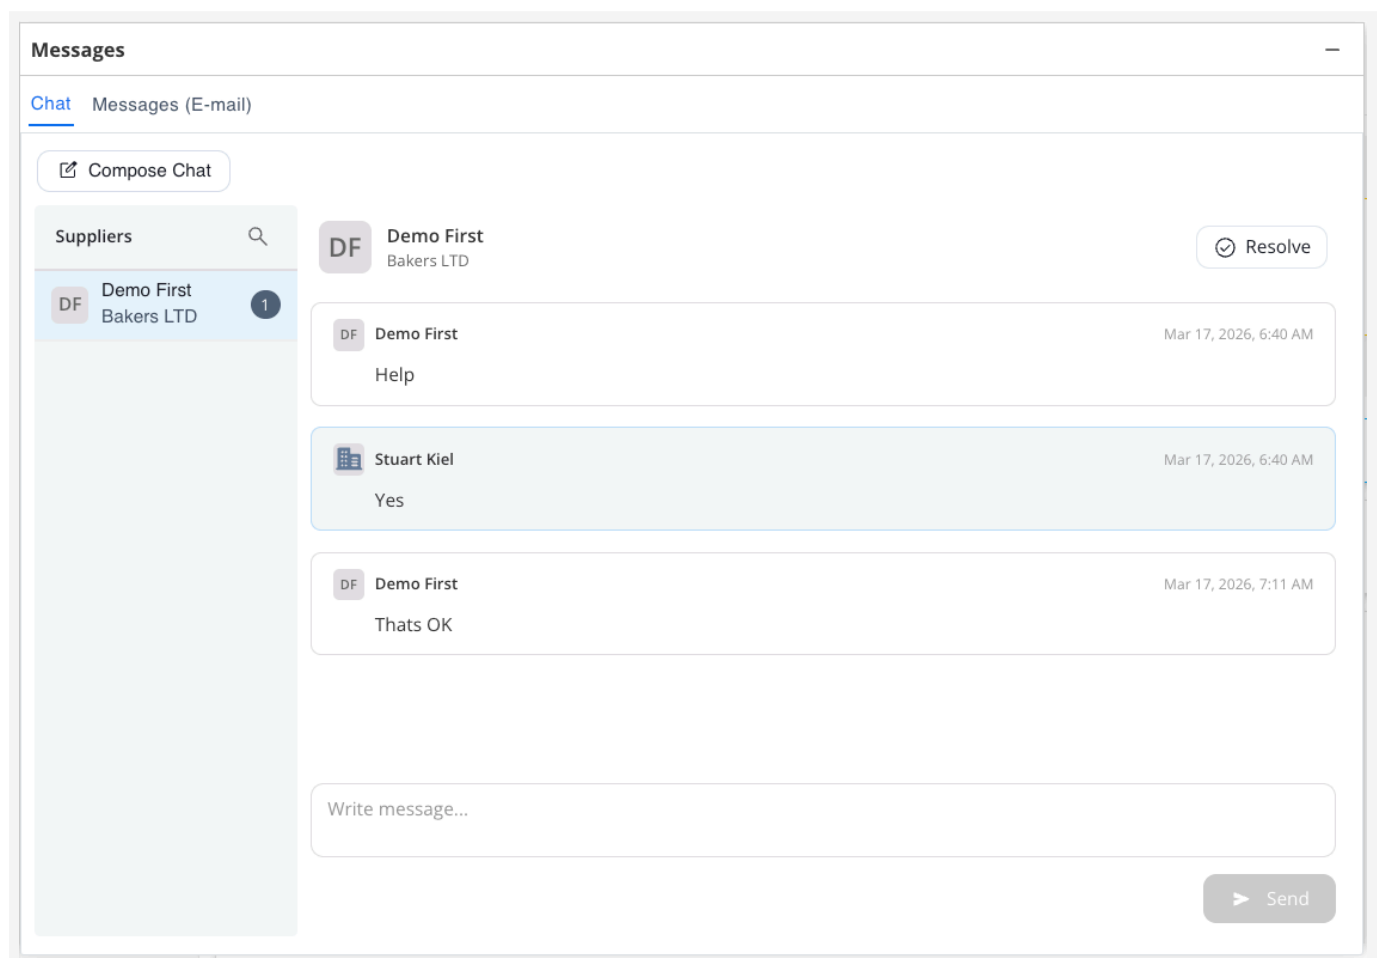

Communicate in real time with online suppliers during sourcing optimization events. Send and receive plain-text messages directly within an event to resolve issues fast.

Engage in live conversations during auctions and other events without leaving the page. The instant messaging feature directly connects your event team with participating suppliers.

The instant chat is available within any Sourcing Optimization event. Select the Messages icon

in the bottom-left corner to open the chat interface.

Use the following chat capabilities:

- Online communication: Communicate with online suppliers. Suppliers can only send a chat message to your event team if at least one event team member with the correct permissions is online. This excludes Admin or Market Manager roles.

- **Broadcast messages:** Send a message to a single supplier, or broadcast a message to multiple suppliers at once. When you broadcast a message, the application creates a separate, private conversation thread for each supplier. Replies from suppliers remain private between the supplier and your event team.
- **Chat resolution:** Mark the chat as resolved when you finish a conversation. Marking a chat as resolved clears the notification and hides the chat indicator for all event team members. If the supplier sends a new message, the chat becomes active again.

NOTE:

Instant messages do not support rich text formatting or attachments.

Roles and permissions

- [Updated system roles](#): Admin, Market Manager, Event Manager, Event Support, Owner.

Integrations

None.

Availability

This feature is included with Coupa Sourcing Optimization. It is on by default.

Release Note Changes

Contract Management

See the features added to Contract Management for the May 2026 Release (R45).

Coupa Contract Lifecycle Management Standard

See the features added to Coupa Contract Lifecycle Management Standard for the May 2026 Release (R45).

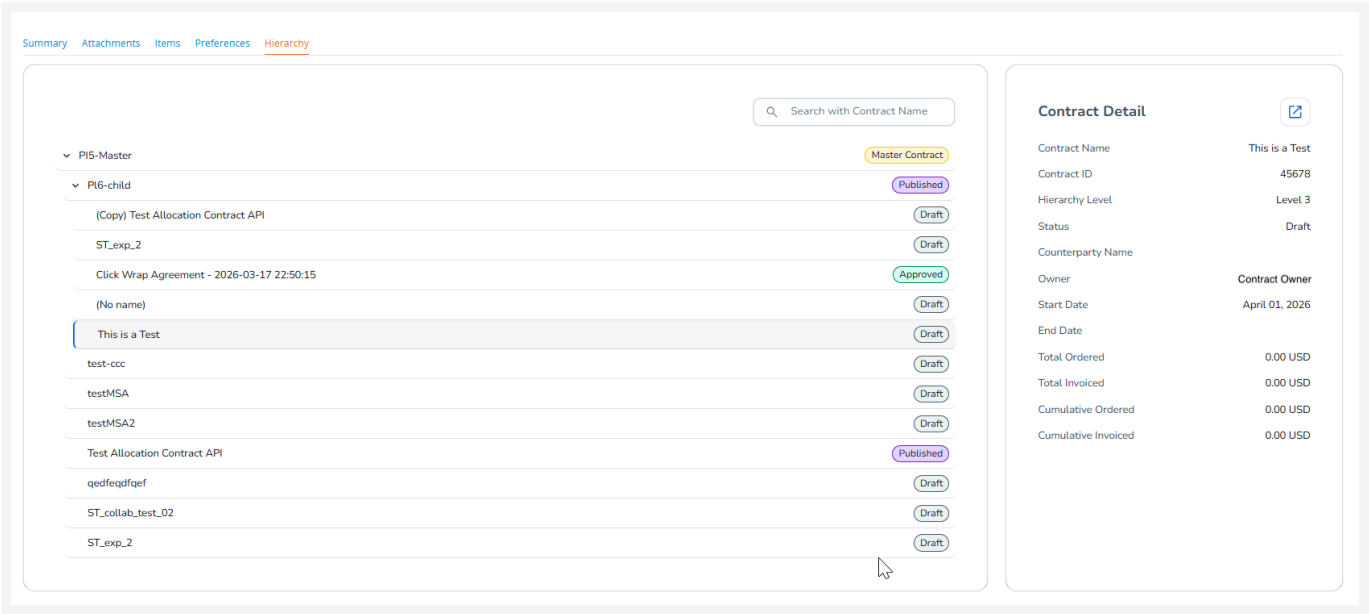

Multi-level Contract Hierarchy

Model complex business relationships by creating and managing contract hierarchies with up to four levels of depth.

Expand contract structuring beyond the standard two-tier model to include up to four levels of hierarchy. This deeper structure helps you represent complex agreements, like master services agreements that govern multiple projects and statements of work. Organizing contracts this way improves visibility into an entire contract family.

Use the **Hierarchy** tab on the contract record to view the complete relationship tree. The left panel of the tab displays an expandable tree structure of the contract family, including the status of each record. When you select a specific record within the tree, the right panel updates to show its contract details, such as start and end dates, and individual and cumulative spend metrics. This visualization respects content groups, ensuring you only see records you have access to.

The following image shows the **Hierarchy** tab, which provides a visual tree representation of a contract family.

When creating or editing a contract, select the supplier and then use the **Parent Contract** lookup field to map hierarchical relationships. Child contracts must share the same supplier as their parent. The lookup includes an indicator when you nest a record under an existing child contract.

NOTE: To reduce manual steps, configure contract presentations to set a default **Hierarchy Type** (such as Master or Contract) based on the contract type.

Roles and permissions

None.

Integrations

None.

Availability

This feature is included with Contract Lifecycle Management Standard and Contract Lifecycle Management Advanced. It is on by default for customers using Contract Hierarchy.

Release Note Changes

None.

Google Workspace Integration for Contract Authoring

Create, tag, and collaboratively edit contract templates and legal agreements using Google Docs.

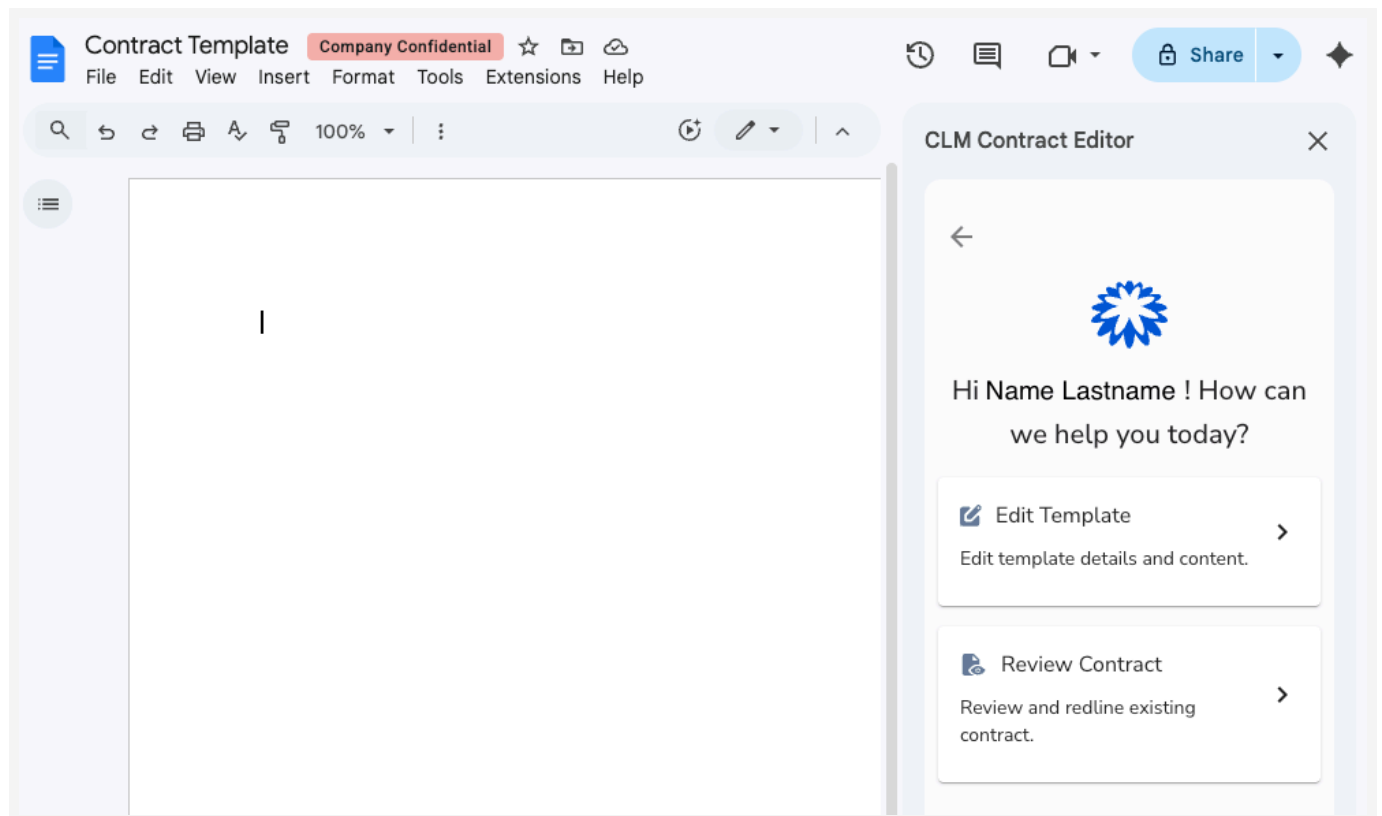

Author and manage contract templates and legal agreements in Google Docs as an alternative to Microsoft Word. This integration supports flexibility for organizations using both Microsoft and Google.

With the Google Workspace integration, you can do the following:

- Create a contract template from Google Docs.
- Include contract fields in the Google template using the Coupa Contracts for Google Docs add-in.
- Create a legal agreement document from a Google Doc template.
- Start collaborative editing sessions in Google Docs to edit a legal agreement.
- Edit contracts that you open directly from your Google Drive using Google Docs. Any changes you make automatically sync back to the contract record the next time you open the document in the application.
- Collaborate with suppliers, even if they do not have a Google account.

NOTE: This integration only supports Google Docs. Your Google Workspace settings govern access control to documents.

The following image shows a Google Doc with the new Coupa Contracts for Google Docs add-in open:

To use this feature, you must enable the **Enable Google Docs for template management and contract collaborative editing** option on the **Company Information** page and designate a Google Drive workspace to store versioned documents. Then, install the Coupa Contracts for Google Docs add-in from the Google Workspace Marketplace.

⚠ **WARNING:** Changing your designated Google Drive workspace breaks access to existing contracts and templates. Although manually moving files to the new folder restores access, the recommendation is to keep the initial storage location.

Roles and permissions

None.

Integrations

None.

Availability

This feature is included with Contract Lifecycle Management Standard and Contract Lifecycle Management Advanced. It is off by default.

Release Note Changes

None.

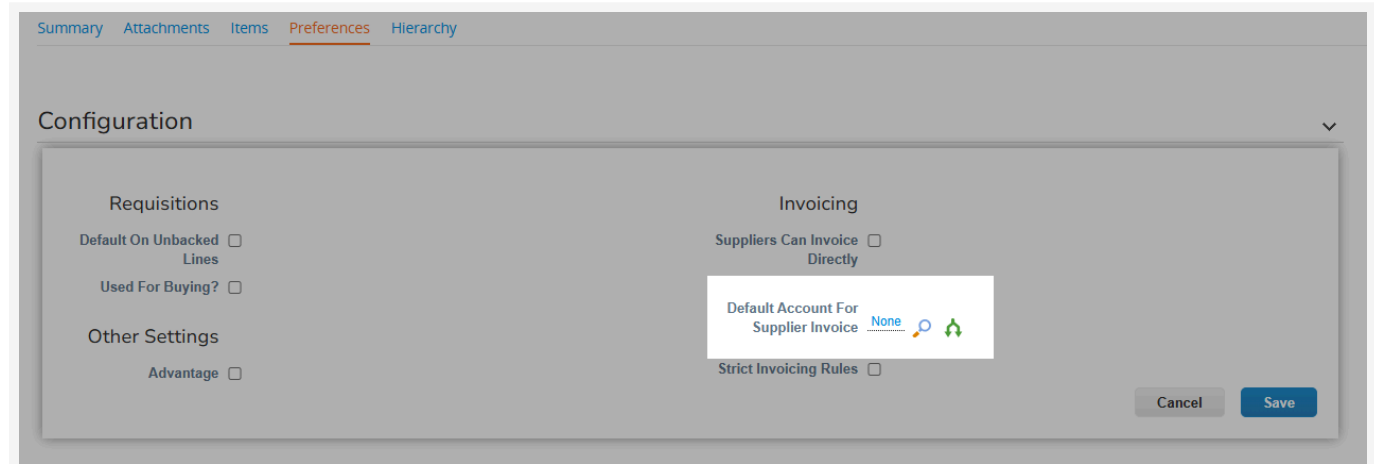

Split Billing on Contracts

Manage complex cost allocations by assigning multiple billing accounts to your contract records using percentage-based splits.

Allocate contract costs across multiple internal billing codes directly on the contract record. Define a default billing split that carries over to downstream non-PO invoices, including those submitted directly by suppliers, to ensure accurate financial reporting and reduce manual adjustments. Setting these defaults at the contract level maintains consistency and simplifies reconciliation.

On the contract's **Preferences** tab, in the **Invoicing** section, select the split icon next to **Default Account For Supplier Invoice** to add accounts from your list and assign a percentage to each. All selected accounts must belong to the same Chart of Accounts.

The following image shows the split icon in **Preferences**→**Invoicing**:

When you or a supplier create a non-PO backed invoice against a contract with split billing, the application automatically applies the defined percentages to the invoice lines. You can still adjust the percentages on individual invoices for exceptions, but these invoice-level changes do not update the contract. Additionally, if you revise the percentages on the contract, either by editing the contract or creating an amendment, the new billing allocation only applies to future invoices.

NOTE: All billing allocations must total exactly 100% before you can save the billing configuration.

Roles and permissions

None.

Integrations

- [Updated inbound APIs](#): Contract
- [Updated CSV exports](#): Contract Account Allocation

Availability

This feature is included with Contract Lifecycle Management Standard and Contract Lifecycle Management Advanced. It is on by default.

Release Note Changes

None.

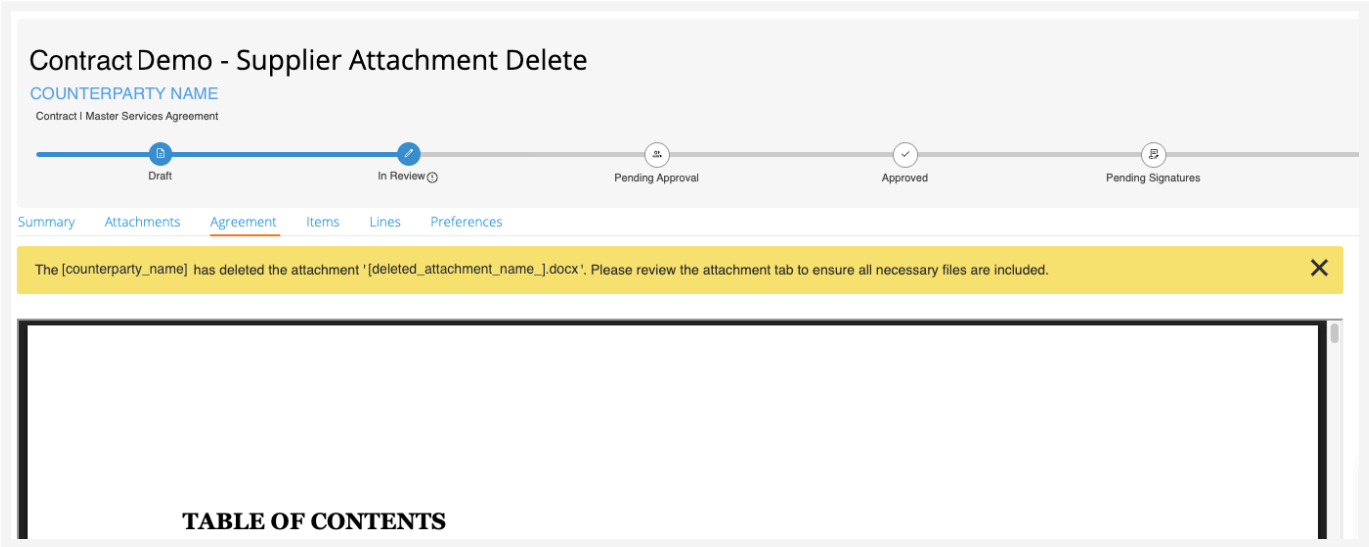

Other Contract Lifecycle Management Enhancements

Review other Contract Lifecycle Management enhancements made for the May 2026 Release (R45).

Warning for deleted attachments

The application displays a yellow warning banner on the **Agreement** tab if a counterparty deletes an attachment. The banner lists all removed files and shows separate warnings if multiple counterparties delete attachments.

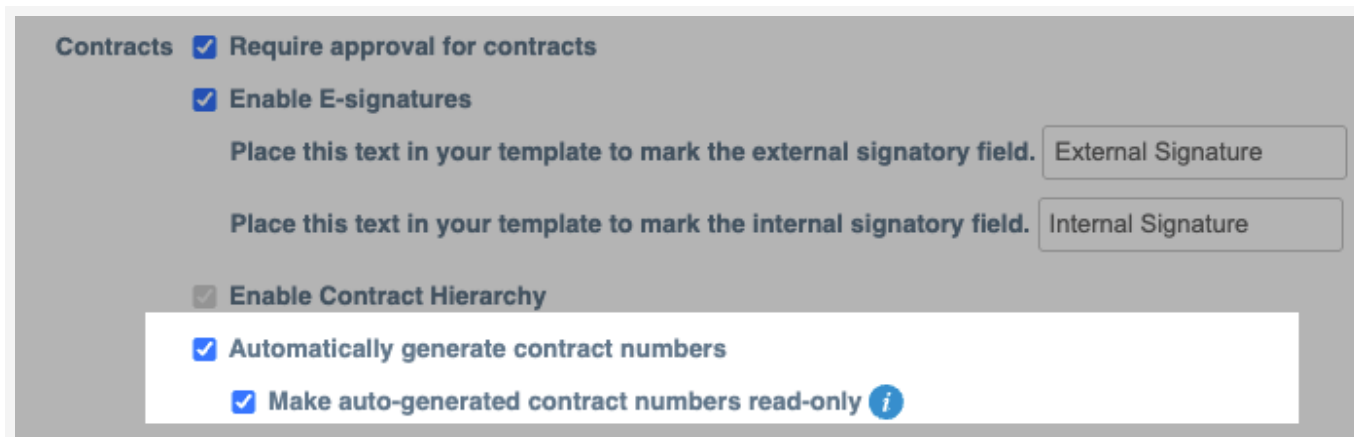

The following image shows the warning banner on the **Agreement** tab:

Read-only auto-generated contract numbers

Prevent users from editing auto-generated contract numbers on the user interface. Select the **Make auto-generated contract numbers read-only** option in the **Company Information** page to lock the contract number field. This option is available only if you first enable the **Automatically generate contract numbers** setting.

The following image shows the new setting on the **Company Information** page:

The screenshot shows a settings interface for 'Contracts'. It includes several checkboxes and text input fields. The 'Require approval for contracts' checkbox is checked. The 'Enable E-signatures' checkbox is also checked. Below this, there are two text input fields: 'External Signature' and 'Internal Signature'. The 'Enable Contract Hierarchy' checkbox is checked. A white box highlights the 'Automatically generate contract numbers' checkbox (checked) and the 'Make auto-generated contract numbers read-only' checkbox (checked) with an information icon.

Contracts ☒ Require approval for contracts

☒ Enable E-signatures

Place this text in your template to mark the external signatory field.

Place this text in your template to mark the internal signatory field.

☒ Enable Contract Hierarchy

☒ Automatically generate contract numbers

☒ Make auto-generated contract numbers read-only ⓘ

ⓘ **NOTE:** You can continue to update contract numbers using APIs or CSV imports even if this setting is on.

Hide the Everyone content group

Restrict users from assigning contracts to the Everyone content group to help secure sensitive contract data from accidental company-wide exposure. If you enable the **Do not default Content Group for Contracts** setting in the **Company Information** page, you can also select the **Hide Everyone Content Group for CLM** setting. This prevents users from selecting the **Everyone** option when creating a contract.

PDF/A format for contract documents

Enable PDF/A compliance for document generation. This feature allows you to select specific compliance levels (for example, PDF/A-2a, PDF/A-2b) for PDF downloads and previews of contract documents.

Enable and configure this feature in the **Workflow Preferences** page of the Contract Collaboration Setup. To prevent invalid signature warnings, the system does not convert completed, published, terminated, or expired documents.

ⓘ **NOTE:** This option is only available when you configure the e-signature integration.

The following image shows the **Workflow Preferences** page with the new **Enable PDF/A Support** setting:

Workflow Preferences

☐ **Require 2 Signatures**
Require 2 members from this organization to sign each contract

☐ **Finish Reviews Before Inviting External Parties**
Prevent inviting external parties to a contract until all reviews are finished

☐ **Warning Message**
Show warning message when invite to sign

☐ **Disable Adding Page Numbers**
Disable adding page numbers to the document for pdf preview downloads

☐ **Enable Upload on behalf of counterparty**

☐ **Enable Content Group Restriction**
Content group assignment will control access to this document. Watchers and Reviewers will still be added dynamically as needed.

☒ **Enable PDF/A Support**
Generate "PDF/A" format for read only contract documents

PDF/A Type

PDF/A-2b

Save Settings

For more information, see [Configure Workflow Preferences](#).

Prevent republishing of expired or terminated amendments

Maintain the status of expired or terminated amendments when a contract is revived. When a new amendment revives an expired or terminated contract, any previously expired or terminated amendments remain in their terminal state. These amendments are not republished, and their dates do not update.

Coupa Contract Intelligence

See the features added to Coupa Contract Intelligence for the May 2026 Release (R45).

Negotiation Playbook

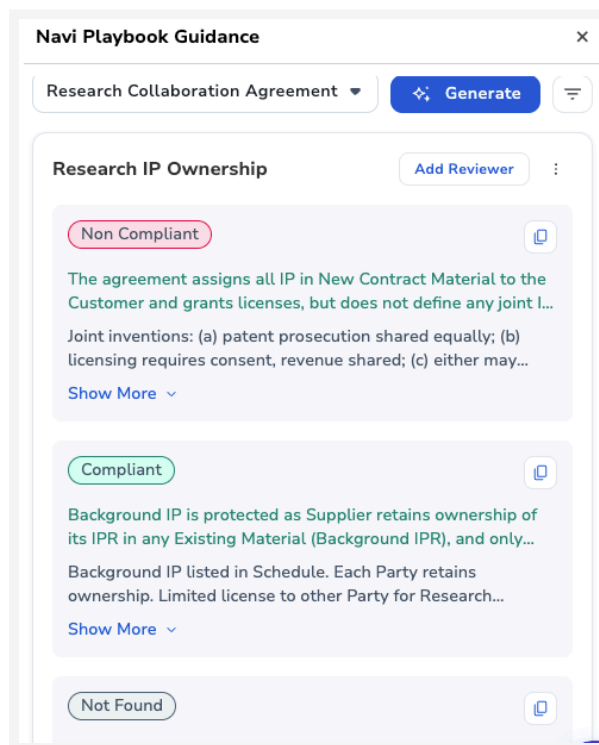

Accelerate contract negotiations and reduce legal dependencies by applying structured, AI-driven playbook guidance directly to your agreements.

Use structured playbooks to guide contract negotiations with real-time recommendations, fallback options, and escalation paths. Negotiators can handle pushbacks confidently, accelerate deal cycles, and maintain compliance with organizational standards. To enable this feature select the **Enable Negotiation Playbook** option under the **Generative AI** settings on the **Company Information** page.

Create playbooks by adding clauses, standard text, rules, and designated reviewers (individual users or user groups). You can also import playbooks using a CSV file. Once you activate the playbook, it serves as the centralized knowledge base for evaluating contracts.

During a negotiation, go to the **Navi Recommendations** section of the **Agreement** tab to select a playbook and categorize clauses in the legal agreement as **Compliant**, **Non-Compliant**, or **Not Found**.

The following image shows the **Navi Playbook Guidance** section on the side panel of the **Agreement** tab:

For each identified issue, the application surfaces the relevant rule, instructions, and alternate text. You can accept the recommendation, copy the alternate text, ignore the suggestion, or add

the designated decision authority to the review chain. The application tracks all actions and status changes for complete visibility.

For more information, see [Manage Negotiation Playbooks](#).

Coupa Risk and Performance Management (RPM)

See the features added to Coupa Risk and Performance Management (RPM) for the May 2026 Release (R45).

Automatically Compare Mismatches in Supplier Records

Buyers with SIM and Coupa Navi™ (Navi) can access the Supplier Document Readiness Agent, which extracts the data from uploaded documents, compares it against the supplier record, and presents any discrepancies found.

As a buyer user with **Admin** or **Supplier Manager** role (and the permissions within), you can see a new tile available in the **Suppliers** dashboard, with the title **Records with discrepancies** (tiles in the **Suppliers** dashboard can be customized).

Selecting the **Records with discrepancies** tile displays a table view with all the suppliers that have discrepancies in their documentation and the SIM record, including their status as a supplier and a breakdown of high, medium and low discrepancies found in the documents the supplier has uploaded.

Each discrepancy presented shows:

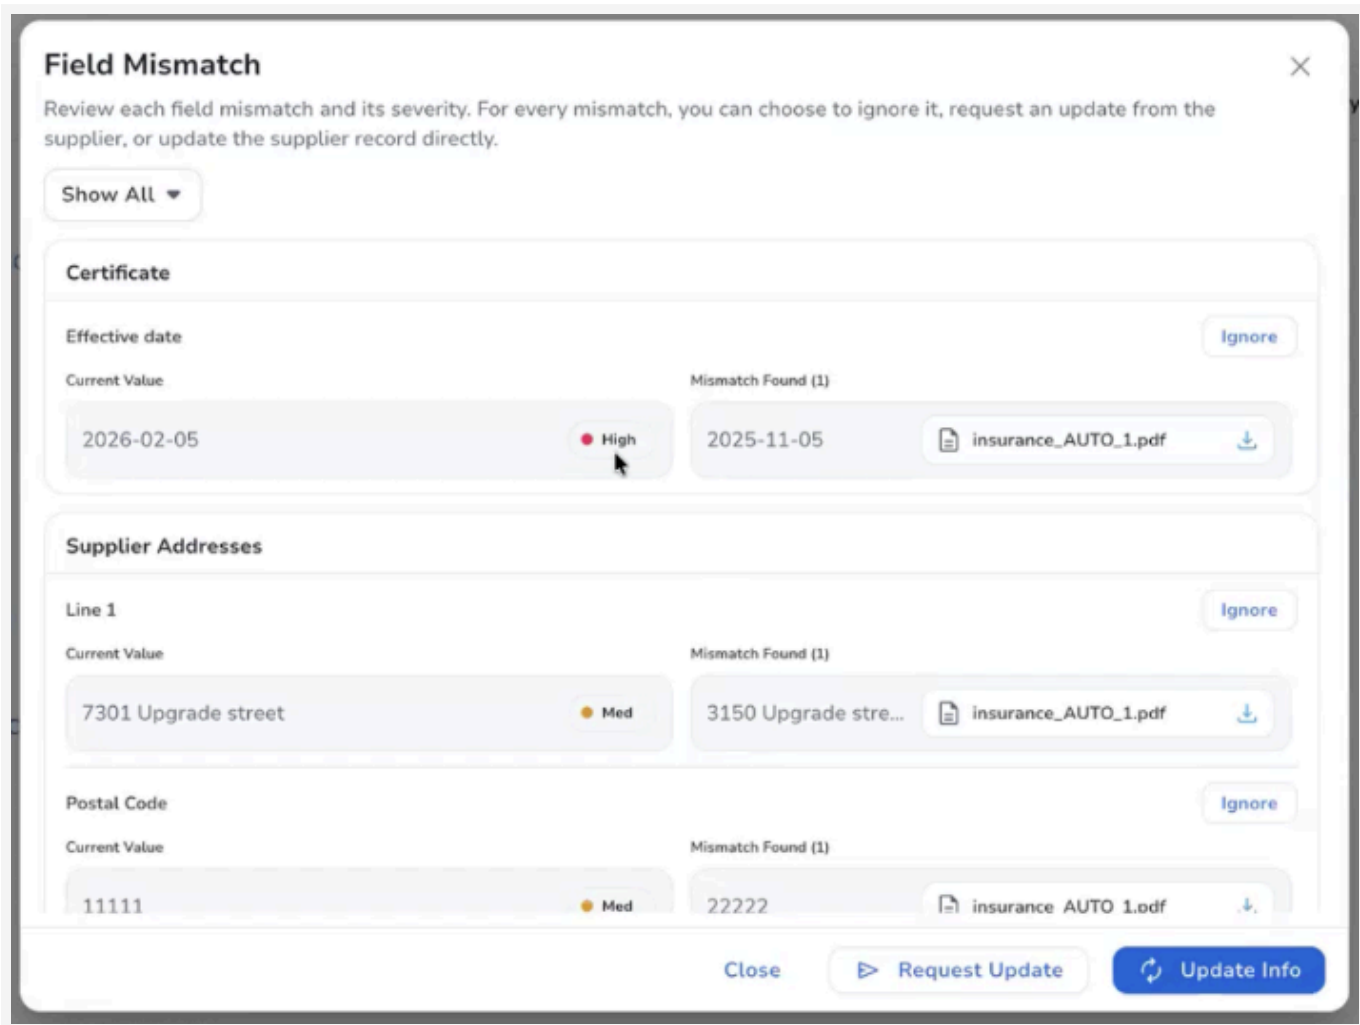

- The field where the discrepancy was found
- The current value in the buyer's records
- The mismatch found: what content was found and the document where it was found. You can download the document to review.

Actionable insights for mismatched fields

For each mismatch, you can:

- Ignore the mismatch and select from a list of options why it's being ignored. This option presents an optional field to leave a feedback message to the AI agent in Coupa, to improve this feature. This specific mismatch will not be presented again to the user.
- Request the supplier to update the information.

Figure 10. How to see a mismatch

Customize your warning preferences

The validation is performed automatically and displays all discrepancies that the **Supplier Document Readiness Agent** is 82% sure about. You can change the score to receive warnings when the confidence score is higher, or lower the threshold to see more mismatches.

The **Supplier Document Readiness Agent** sorts discrepancies into different prioritization categories depending on the field that found the mismatch. You can change the desired level assigned to each field.

For more information, see the following pages:

- [Supplier Dashboard](#)
- [Detect Mismatches in Supplier Records](#)

Roles and permissions

Release Note Changes

None.

Sanctions Risk Agent

Screen suppliers against global sanctions lists with Coupa Navi™ and identify potential supplier risk.

Coupa Navi™ now includes a Supplier Risk Profile Agent that can help you identify potential risks. Check a supplier record for matches against major global sanctions lists, including the United States, European Union, and United Kingdom.

You can run screenings as part of your pre-onboarding vetting process or at any time through a natural language conversation with Navi. For example, ask, “Run a sanctions check on Acme, Inc.”

When evaluating a supplier, follow Navi’s guided prompts to confirm the correct entity and improve screening accuracy.

Supplier: ACME, INC.

Status: Match Found (1 match)

Match 1 (US - US Consolidated Screen List):

- List Updated: 03/10/2026
- Score: 100% | Strength: Very Strong
- Matched Name: ACME, INC.
- Finding: Exact name match
- Address: Full match (123 MAIN STREET, ANYTOWN, CA 90210)

Lists Checked:

- US Consolidated Screen List (US)
- EU Commission
- HM Treasury (UK)

Follow-up Recommendation:

Very strong alignment — exact name and address confirmation. **Immediate escalation** to compliance team required. **Do not proceed** with supplier onboarding or transactions until cleared.

Is this a false positive?

What should I do next?

Supplier 360

View all of a supplier's key information and take actions in a single, unified profile. Quickly evaluate their health, performance, and activities without needing to navigate multiple pages.

A modernized view of a supplier’s information called **Supplier 360** brings together to-dos, activities, spend, supplier health, and community insights into a single dashboard. Quickly access valuable insights on a supplier, track current activities, and complete tasks from a streamlined interface.

Navigate between the supplier record and related documents without leaving the supplier profile. Interactive widgets allow you to take quick actions and review key metrics.

Supplier 360 respects your existing user permissions, so you only see data you are authorized to view.

When enabled, the Supplier 360 view appears whenever you access a supplier record, whether by navigating from the **Suppliers** page or from another location within your Coupa environment.

On the left side, you see the supplier name and key details. Click on **Supplier Record** to see all of the supplier's information or use the **Actions** menu to take next steps, such as requesting a supplier review, starting a risk assessment, or requesting and updating supplier information.

Supplier 360 is organized into the following sections: **To-Do**, **Current Activities**, **Health**, and **Community**.

The **To-Do** section organizes items requiring your attention into two categories:

- **Opportunities** highlight potential action items like addressing expiring certificates, updating outdated supplier data, or reviewing increased spend.
- **Tasks** are actionable items needing your approval for things like contracts, invoices, or supplier information updates.

To-Do

Supplier Landing Widgets

A modernized Suppliers homepage provides a personalized dashboard view of your suppliers.

The Suppliers homepage now includes a modernized layout called the **Supplier Dashboard Experience**. This dashboard provides a quick overview of your suppliers, along with improved search and filtering options that help you find information faster. The view reflects your existing user permissions, so you only see data you are allowed to access.

Use the search bar to quickly find suppliers, forms, and processes in one place. Search results provide detailed information so you can quickly find what you are looking for.

Interactive widgets provide key supplier insights at a glance, such as:

- Top suppliers by spend
- Supplier status distribution
- Supplier health distribution
- Invoices by status
- Certificates, forms, and diversity tracking

You can customize your dashboard by pinning up to your maximum configured widgets. Available widgets depend on your role.

Dashboard Preferences

Customize your dashboard layout! Select **max 7 data widgets** most relevant to your needs. Your preferences will be applied immediately after saving.

Supplier Risk Profile Agent

Generate a risk profile with Coupa Navi™ to gain insights into supplier performance and potential risk.

Coupa Navi™ now includes a **Supplier Risk Profile Agent** that provides you with key risk insights for any of your suppliers.

You can generate a supplier risk profile during a sourcing event or at any time through a natural language conversation with Navi. For example, ask, “Generate a risk profile for Acme, Inc.”

Navi guides you through confirming the correct supplier to ensure accuracy. Within moments, you receive a summary that includes:

- General information (parent entity, country of registration, etc.)
- 3rd party risk metrics (overall risk score, inherent risk, residual risk, etc.)
- Performance metrics (quality score, incident history, buyer rating, etc.)

Navi also provides industry best-practice recommendations based on these insights.

 Navi

3rd Party Risk Metrics

- **Supplier health category: High Risk (F rating)** - supplier with significant concerns.
- **Financial, judicial, and ESG scores** are not available; **news sentiment** is **neutral (0.0)**.
- **No bankruptcy risk** detected; **screening status** is not available.

Performance Metrics

- **Overall performance grade** is not yet rated.
- **No supplier disputes** reported, but **market-level disputes** are at **5.7%**.
- **Supplier overages** are **29.27%**, with **market overages** at **41.73%**.
- **Supplier supports** electronic invoicing (CSP) and catalogs.

Recommendations

- Consider temporarily placing this supplier on hold due to higher than average disputed invoice rate. [Put On Hold](#)
- Review PO to invoice details to ensure accuracy. [View Invoices](#)
- Review rejected invoices from the last 30 days for potential disputes. [View Invoices](#)
- Explore electronic invoicing support and enablement process. [Alternative Suppliers](#)
- Review supplier performance dashboard for catalog channels to streamline procurement. [Details](#)

Supplier Risk Profile - Full Detail Summary

Suppliers Tasks in the Workbench

When a buyer sends the supplier a SIM form or a business profile request, the supplier can see it in their workbench as a task to complete.

The **Coupa Supplier Portal (CSP) Workbench** is designed to simplify the work of suppliers by providing a centralized view of all the requests of their customers.

SIM forms translated to tasks

When creating a **SIM form**, you can:

- Set a task's **Priority** (from **High**, **Medium** and **Low**).
- Define a **Task Due Date Duration (in days)** on the section **Additional Settings**.
- Select the option to cancel the task automatically after a certain amount of days by marking the **Auto Cancellation** option.

When you reject a received form from a suppliers, a new task appears on the supplier's **Workbench** requiring a new submission.

Figure 11. Configure task auto cancellation, priority and due date

The screenshot displays the 'Configure task' interface in Coupa. It includes several sections for configuring task behavior:

- Auto Reminder:** A section with a checked checkbox and an information icon. It contains a text input for the reminder day (set to 2) and four rows for 'Reminder 1 on Day', 'Reminder 2 on Day', 'Reminder 3 on Day', and 'Reminder 4 on Day' with values 2, 5, 10, and 15 respectively. Each row has a red 'X' icon. Below these is a checkbox for 'Notify requester of delayed response'.
- Auto Cancellation:** A section with a checked checkbox and an information icon. It contains a text input for 'Cancel on Day' (set to 23) and a checkbox for 'Notify requester when cancelled'.
- Auto Approve:** A checkbox.
- Auto Apply:** A checkbox.
- Tags:** A section with an 'Add Tag' button.
- Hide From Search:** A checkbox.
- Preferred for Guided Request:** A section with three radio buttons: 'Always', 'Never', and 'Automatic' (which is selected).
- Additional Settings:** A section with a 'Task Priority' dropdown (set to 'Medium') and a 'Task Due Date Duration (Days)' text input (set to 3).
- Questionnaire:** A section with a '2' icon and a 'Questionnaire' title.
- Add Field:** A section with a text input 'Start typing to add a field' and a dropdown arrow.

At the bottom right, there are links for 'Collapse All' and 'Expand All'.

How suppliers experience the tasks

Suppliers receiving the task can fill out the form directly in the **Workbench** page without navigating to other sections in Coupa.

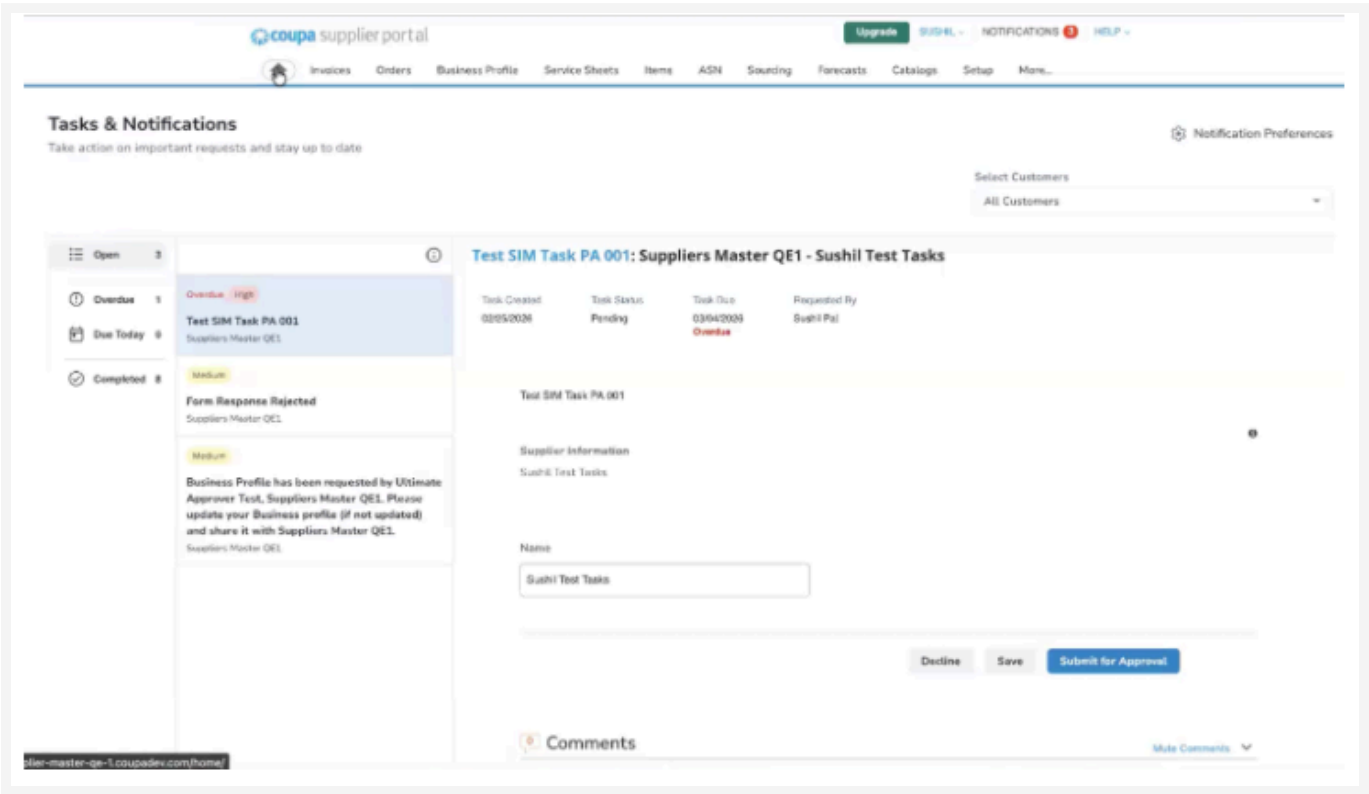

They can:

- Complete the task by sending the form for buyer's approval
- Decline the task with a comment
- Withdraw the submission when the form has been sent, but is still in **Pending Approval** status (the buyer has not yet accepted the incoming changes) in order to change it.

This removes the task from the **Completed** section and moves it to the **Open** section (after

some minutes).

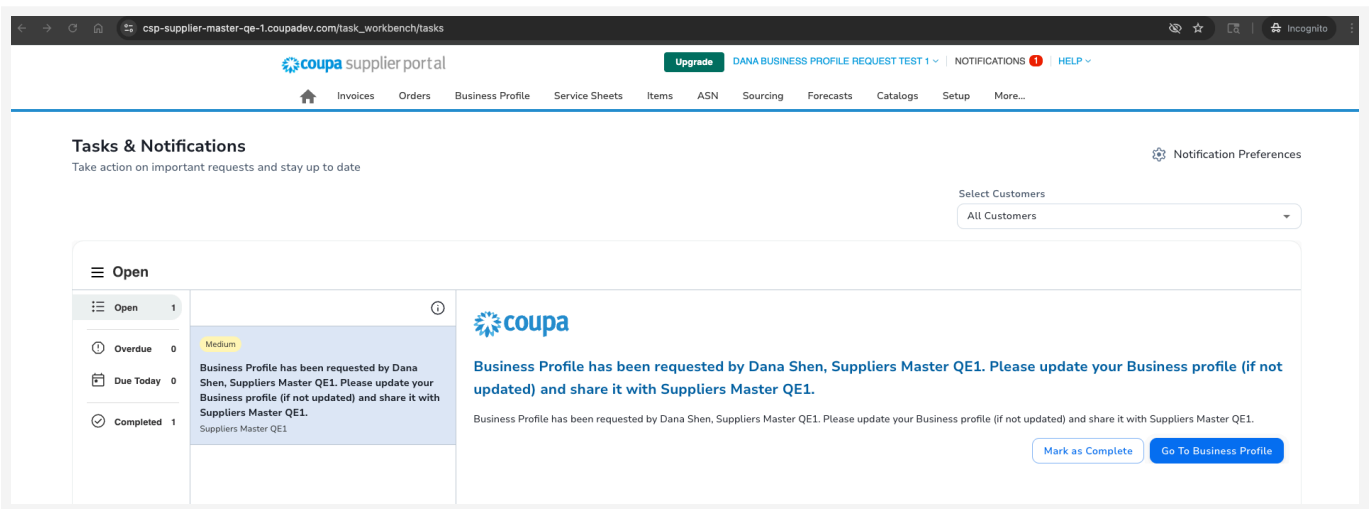

Figure 12. How suppliers see tasks in the Workbench

Business profile requests translated to tasks

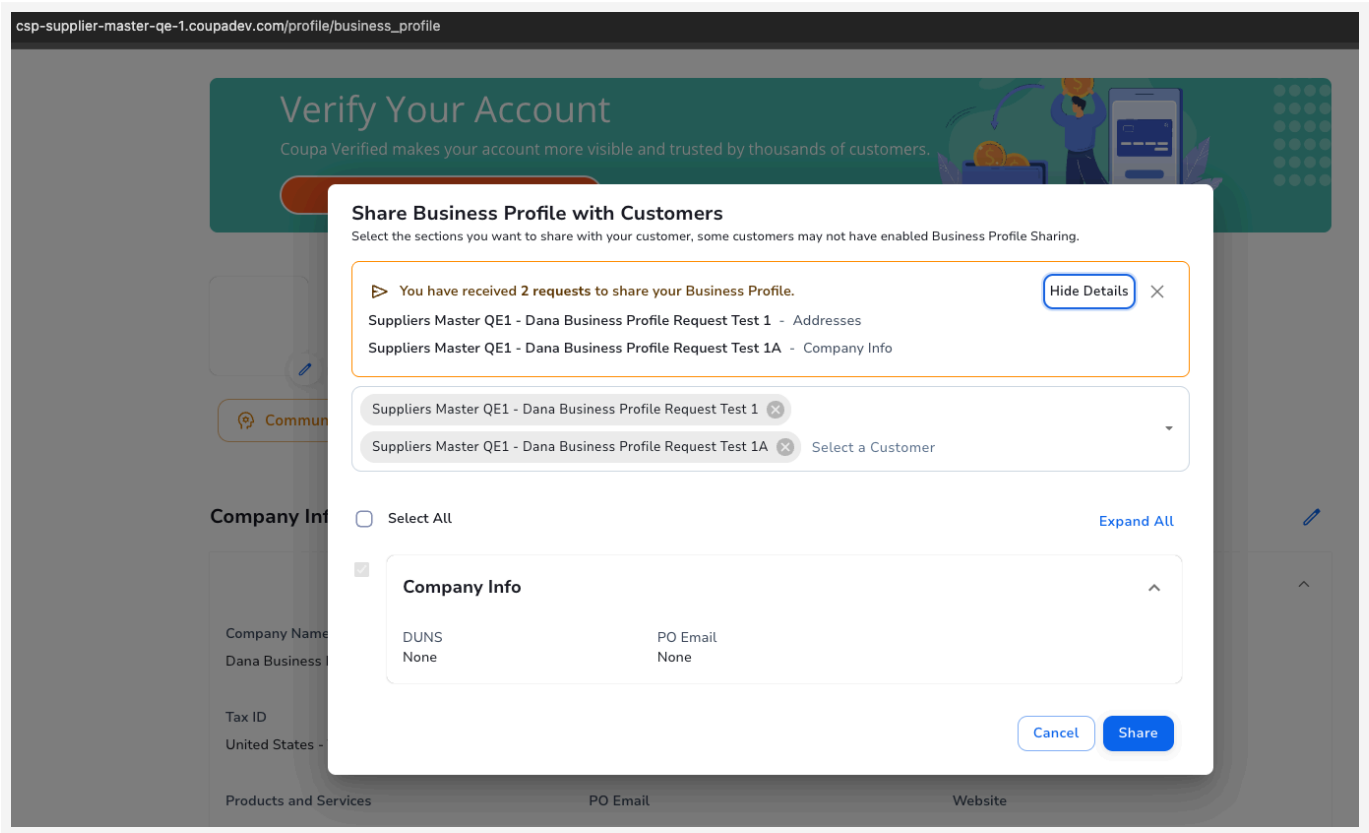

When you request a Business Profile from a supplier, they get a notification on their home page and a task on their workbench.

Figure 13. Business Profile task in the Workbench

Suppliers can see when multiple buyers have requested business profile updates for different fields.

Lightweight Supplier Onboarding in Navi

Buyers can use Coupa Navi™ (Navi) to discover internal or community suppliers and onboard them directly through the chat window.

With the **Supplier Onboarding Agent**, you can onboard a supplier discovered through Navi.

When you ask Navi to find suppliers that meet specific criteria, the chat window presents the list of suggested results (**Internal** suppliers linked with your account, or **Community** suppliers registered in Coupa). You can see an overview of the supplier's information, along with the option to **Onboard Supplier** if the supplier is not linked to your profile.

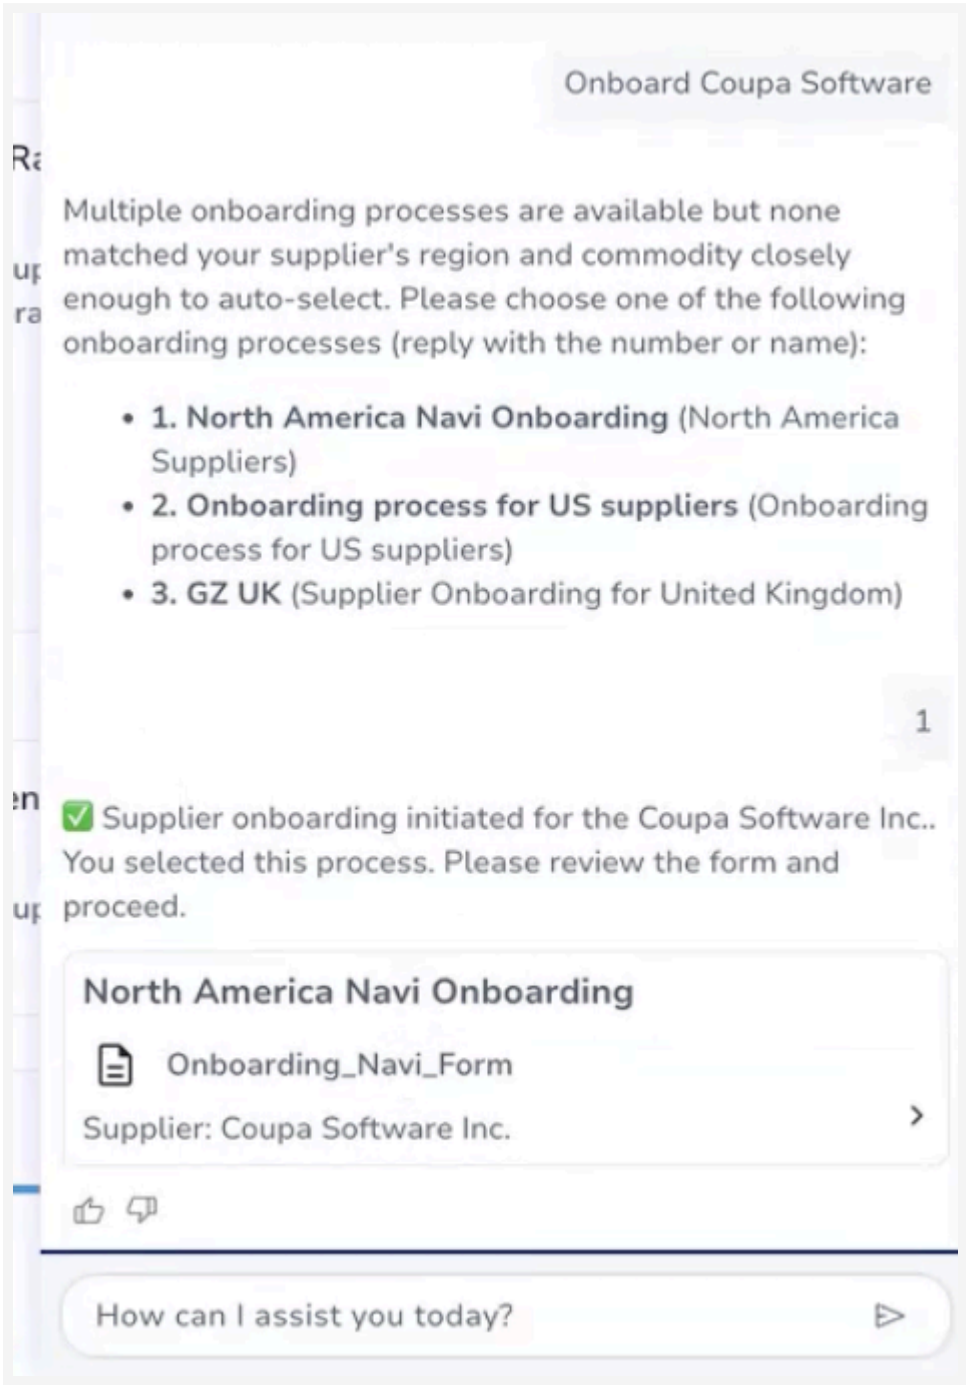

Figure 15. Use Navi to discover suppliers

Navi presents the possible onboarding processes with their corresponding forms, and pre-fills

the fields when possible, without redirecting the user.

Figure 16. Onboard suppliers directly in Navi

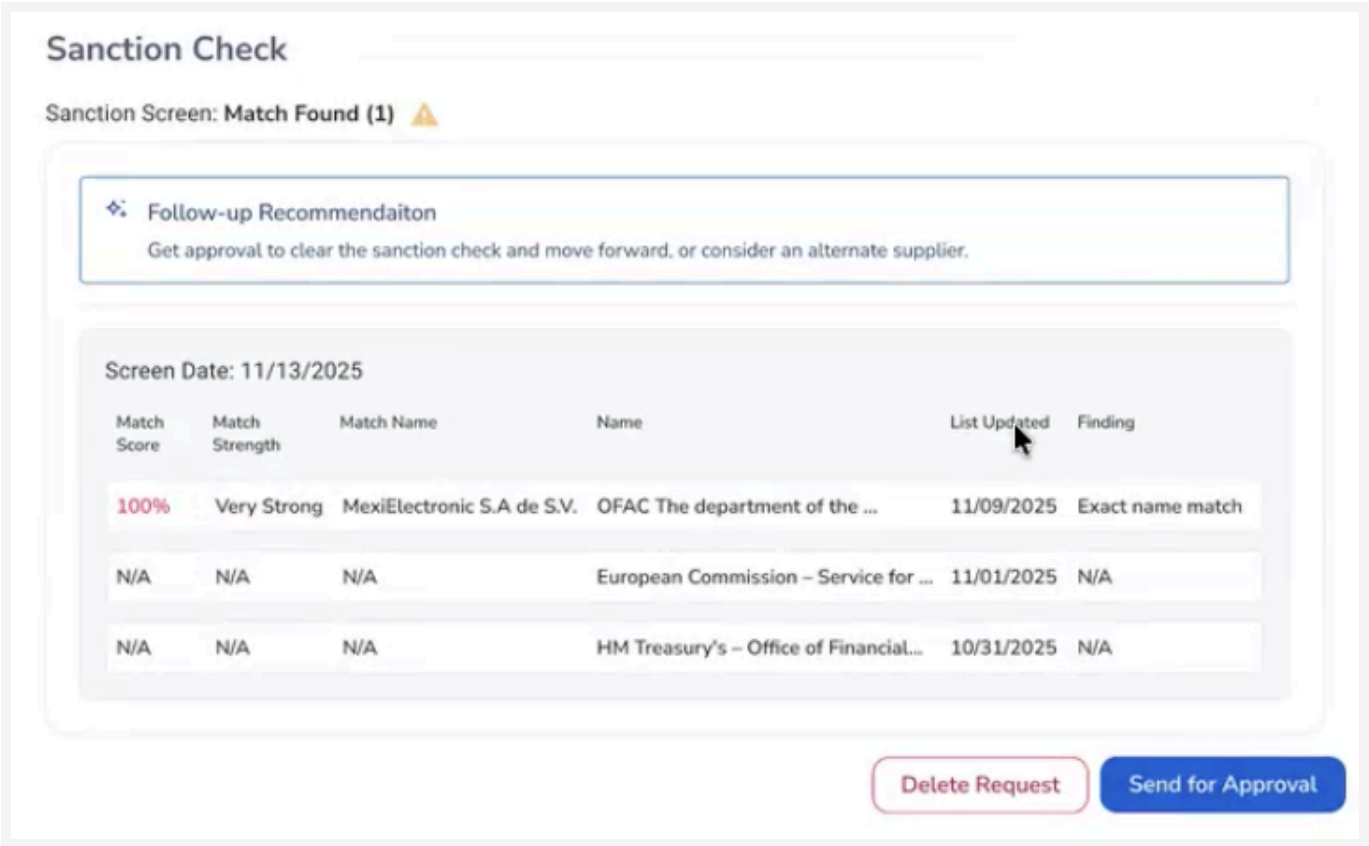

Buyer users going through this process have the option to review the form and the pre-filled answers, and send for approval in their regular onboarding approval process.

After the corresponding form, users can see the **Sanction Check** section where Navi displays the results of a sanction screening of the particular supplier before sending for approval. If the

supplier is found on the sanction check then you can still make the decision to **Send for Approval** or not.

Figure 17. Sanction screen a supplier before onboarding

Results on the sanction screening persist and can be consulted in the future through the **Setup→Form Responses**page. They can be used for audit purposes.

Figure 18. Find the date a supplier was screened for sanctions

Release Note Changes

None.

Coupa Risk and Performance Management – Advanced (RPMA)

See the features added to Coupa Risk and Performance Management – Advanced (RPMA) for the May 2026 Release (R45).

Coupa Risk Assess REST API Enhancements

Retrieve and update data from your Coupa Risk Assess tenant using new REST endpoints.

Risk Assess REST API now includes the following requests:

- GET `/api/engagement` : Retrieve engagement data from your Coupa Risk Assess tenant.
- GET `/api/evaluations/{id}/kpis` : Retrieve evaluation question and answer data from your Coupa Risk Assess tenant.
- GET `/api/users` : Retrieve supplier and internal user data from your Coupa Risk Assess tenant.
- PUT `/api/users` : Update user data in your Coupa Risk Assess tenant.
- PUT `/api/relationships` : Update relationship data from your Coupa Risk Assess tenant.

Scopes required to use these APIs include: riskassess.engagement.read, riskassess.evaluation.read, riskassess.user.read, riskassess.user.write, riskassess.relationship.write.

Detailed product documentation will be provided closer to the May 2026 release (R45). For more information, see [Risk Assess Rest API](#).

Roles and permissions

More information to be provided in the final version of release notes.

Integrations

More information to be provided in the final version of release notes.

Availability

This feature is part of Risk Aware. It is on by default and configurable.

The Risk Assess REST API requires a Coupa Core instance with OpenID Connect (OIDC) authentication. Submit a Risk Assess support ticket to request the REST API feature to be enabled for your tenant.

Release Note Changes

None.

Spend Analysis

See the features added to Spend Analysis for the May 2026 Release (R45).

Coupa Advanced Analytics

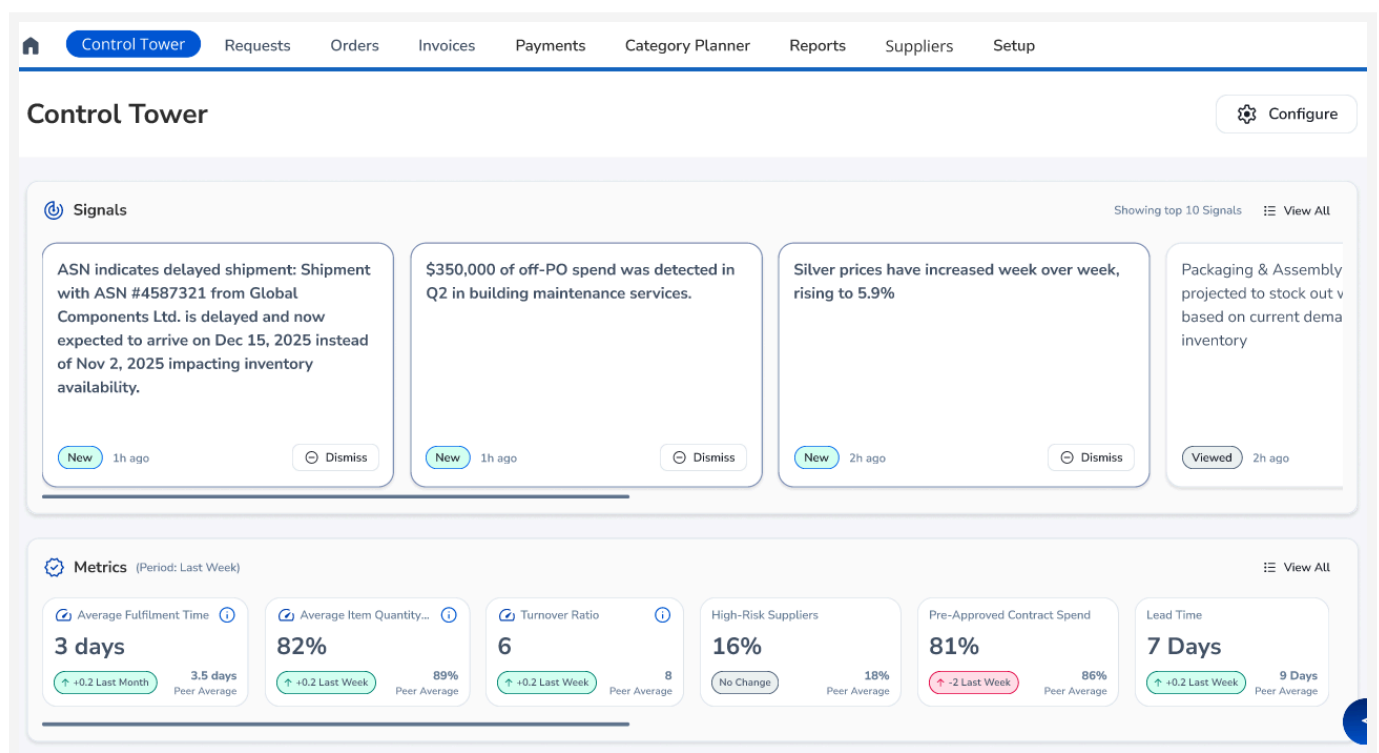

See the features added to Coupa Advanced Analytics for the May 2026 Release (R45).

Control Tower

Use the Control Tower as a centralized hub for monitoring metrics and intelligent alerts called signals.

The Control Tower is a centralized command center that enables you to identify opportunities and proactively manage disruptions to mitigate risks. It aggregates data and insights across all Coupa applications, enabling you to monitor metrics, track critical activities, identify bottlenecks, and uncover opportunities through intelligent analysis and alerts.

On the primary navigation bar, select **Control Tower**. The **Control Tower** overview page displays all your signals (potential disruptions) and pinned metrics (KPIs and predictive leading indicators) as cards with details.

As an admin, you can select or deselect the **Signal Setup** checkbox from the **Configure** option to show or hide signals. All signals are enabled by default.

If enabled, the Control Tower shows the following signals:

- Inventory: delayed shipment, staggered shipment, and lower than promised quantity.
- Opportunity analysis: unmanaged spend opportunities for non-PO-backed and off-contract spend and for supplier fragmentation.

You can view, dismiss, or act on signals.

Below the signals, you can see and pin metrics, for example, average fulfillment time, average item quantity fill rate, or pre-approved contract spend.

For more information, see [Control Tower](#).

Roles and permissions

- [New system roles](#): Control Tower Admin, Control Tower User
- [New controllers](#): Control Tower, Signal Configurations, Signals

Integrations

None.

Availability

This feature is available only for customers that participate in the [Early Access Program \(EAP\)](#). If you want to be an EAP customer, contact your Coupa representative.

For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

Release Note Changes

None.

Analytics Enhancements

See the new explores and tables, and the updated tables and fields added for reporting on procurement, product usage, unmanaged spend, and more. Also, use new and updated CPO and Product Usage dashboards.

New explores

New explores are added with existing and new tables as follows:

Explore	Table
Procure to Pay	Commodities, Procure to Pay Usage (new), Product Usage, Suppliers
Unmanaged Spend Lines	Chart of Accounts, Commodities, Invoices, Orders, Suppliers, Unmanaged Spend Lines (new)

For more information, see [Data Explores Overview](#).

New tables

New tables with fields are added to existing explores as follows:

Explore	Table
Commodities, Suppliers, Sourcing	Dynamic Markets, Dynamic Markets Memberships

For more information, see [Data Explores Overview](#).

New and updated fields

New fields are added to existing tables and existing fields are renamed as follows:

Table	Field
Chart of Accounts	Chart of Accounts Address Name, Chart of Accounts State, Chart of Accounts Country

Table	Field
Cycle Counts	Balance Quantity -> On-Hand Balance, Quantity -> Counted

For more information, see [Coupa Analytics](#).

New and updated dashboards

The following CPO dashboards are added to built-in dashboards for Invoicing:

- CPO Dashboard - Invoice Strategic
- CPO Dashboard - Invoice Operational

For more information, see [Built-In Dashboards for Invoicing](#).

The following CPO dashboards are added to built-in dashboards for Procurement:

- CPO Dashboard - PO Strategic
- CPO Dashboard - PO Operational

For more information, see [Built-In Dashboards for Procurement](#).

The following Product Usage dashboards are added to built-in dashboards for Product Usage:

- Product Usage - Advanced Analytics
- Product Usage - Expense Management
- Product Usage - Enterprise License Agreement (ELA)

For more information, see [Built-In Dashboards for Product Usage](#).

Roles and permissions

Availability

These enhancements are included with Coupa Advanced Analytics. However, data is populated

only if you have the relevant applications.

Release Note Changes

None.

Coupa AI Classification

See the features added to Coupa AI Classification for the May 2026 Release (R45).

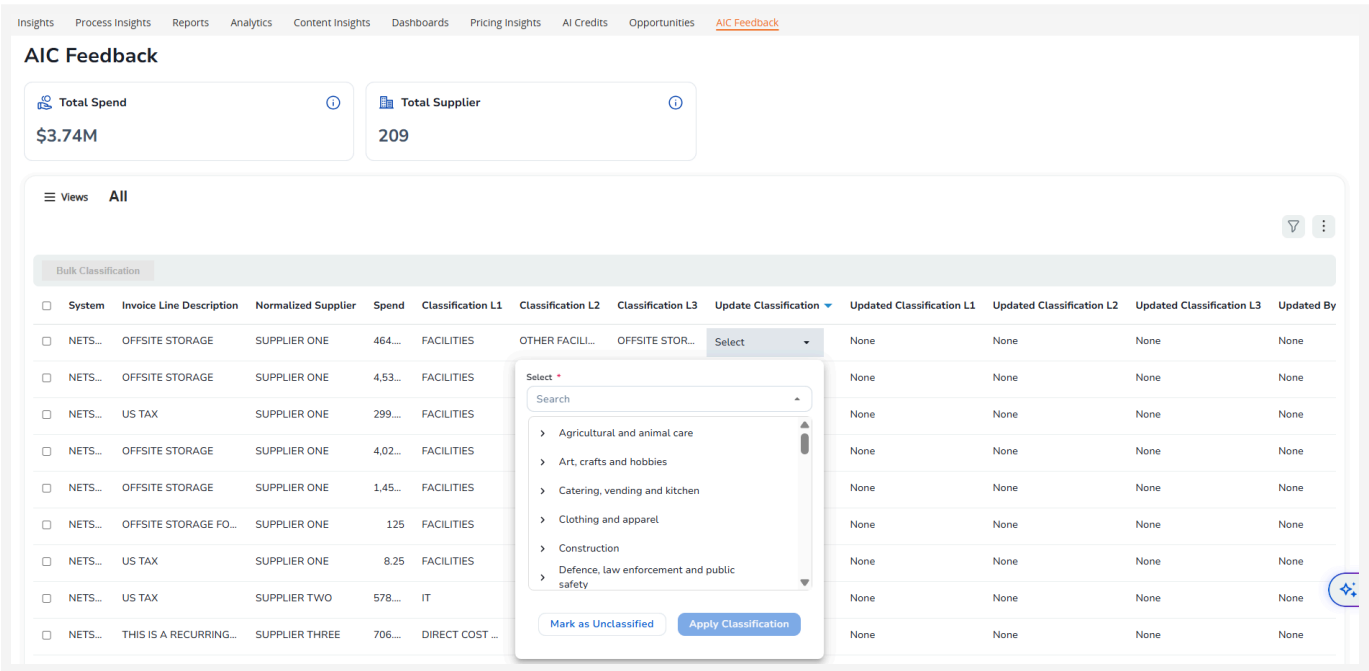

Classification Enhancements and Feedback Workflow for AIC

Provide feedback on AIC commodity classification and submit changes to update your reports in Analytics. Also, enhance your commodity classification leveraging generative AI.

Feedback workflow

You can review and submit feedback on your AI Classification (AIC) data directly from the user interface.

The **Reports**→**AIC Feedback** page displays Analytics cards and a table.

The Analytics cards show your total spend amount and total number of normalized suppliers based on filtered data. The cards are refreshed when the filters are applied.

The table has the following columns by default: System, Invoice Line Description, Normalized Supplier, Spend, Classification L1 - 4 (L4 by default, but possible up to L7), Update Classification (dropdown), Updated By, and Updated At.

You can update the commodity classification at any level by choosing the new classification from your taxonomy in AIC. You can update the classification at line level or use bulk classification. The updated classifications appear in their dedicated columns.

Your changes are updated in Analytics any time within four hours depending on the data refresh schedule.

Using generative AI (GenAI) improves the precision and accuracy of your commodity classification.

For more information, see [AIC Feedback](#).

Roles and permissions

- [New system roles](#): AI Classification Commodity Feedback
- [New controllers](#): AIC Feedback

Integrations

None.

Availability

These features are part of Coupa AI Classification. They are on by default. To opt in to use GenAI, contact your Coupa representative.

For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

For more information, see the [Coupa Artificial Intelligence-Specific Terms](#) and [Legal](#).

Platform

See the features added to Platform for the May 2026 Release (R45).

IP Whitelisting for OAuth

Restrict OAuth token usage to trusted networks by enabling IP whitelisting for OAuth clients and reduce the risk of unauthorized API access.

From **OAuth2/Openid Connect Clients**, you can apply IP whitelisting to ensure API requests are accepted only from trusted networks. When enabled, the system validates the source IP address of each request and blocks any that originate outside the configured range, even if the OAuth token is valid.

Configure Archive Deletion Dates Based on Document Terminal State

Configure archive deletion to calculate retention from the document's terminal state (completion date) instead of its archival date.

Control how you calculate deletion timelines by switching the reference point from the archival date to the terminal state date. You can ensure retention periods align with policy requirements, even when documents are archived later than their completion date. When you enable this setting, the system calculates both online and archive deletion using the terminal state date and updates deletion dates for previously archived documents to match this logic.

To activate this feature, navigate to **Setup→Company Information→System Options** and select **Coupa Archive: Calculate the deletion offset from the terminal state date, instead of the document archival date**.

For more information, see [Compliant Archive](#).

Roles and permissions

Integrations

None.

Availability

This feature is part of Archive Premium. It is on by default.

Release Note Changes

None.

Enhanced Visibility of the Archive Process

Monitor archive jobs to understand execution status, processed documents, and failures across your archival policies.

Track how your archive process executes and review detailed results for each job. You can:

- View when each archive job ran and its status for each policy.
- Compare the number of documents planned for processing with the number actually archived.
- Track how many documents were successfully archived and how many failed.
- Review failed documents at any step in the archive process, including failure details.
- Retain archive records for documents deleted from offline storage to maintain audit history.
- Access existing error pages directly from archive job details to investigate issues.

Use this information to validate archive execution, troubleshoot failures, and understand archive outcomes.

To view this feature, go to **Setup > Data Archive and Retention Policies**.

Redesign of the Suppliers Landing Page

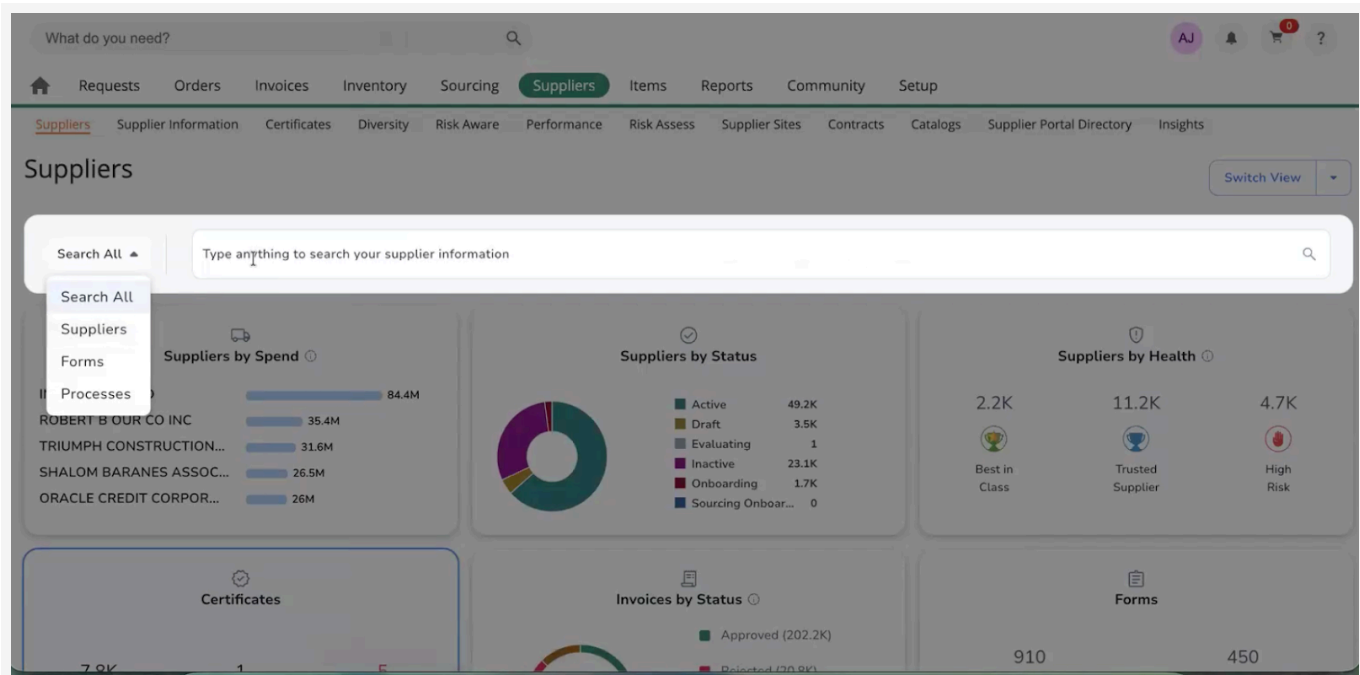

The **Suppliers** landing page is redesigned to present faster access to relevant information, with customizable widgets and dynamic table views.

The **Suppliers** page changes, and you can see several tools:

Improved search bar at the top

Provides an enhanced view of all suppliers (**Internal** and **Community** suppliers not yet linked to the buyer), forms and processes available in the portal.

Figure 19. Searchbar options on the **Suppliers** page

This searchbar provides more detailed information for each result and includes the option to see all search results in a table view on that same page.

Figure 20. Results from the top searchbar in the Suppliers page

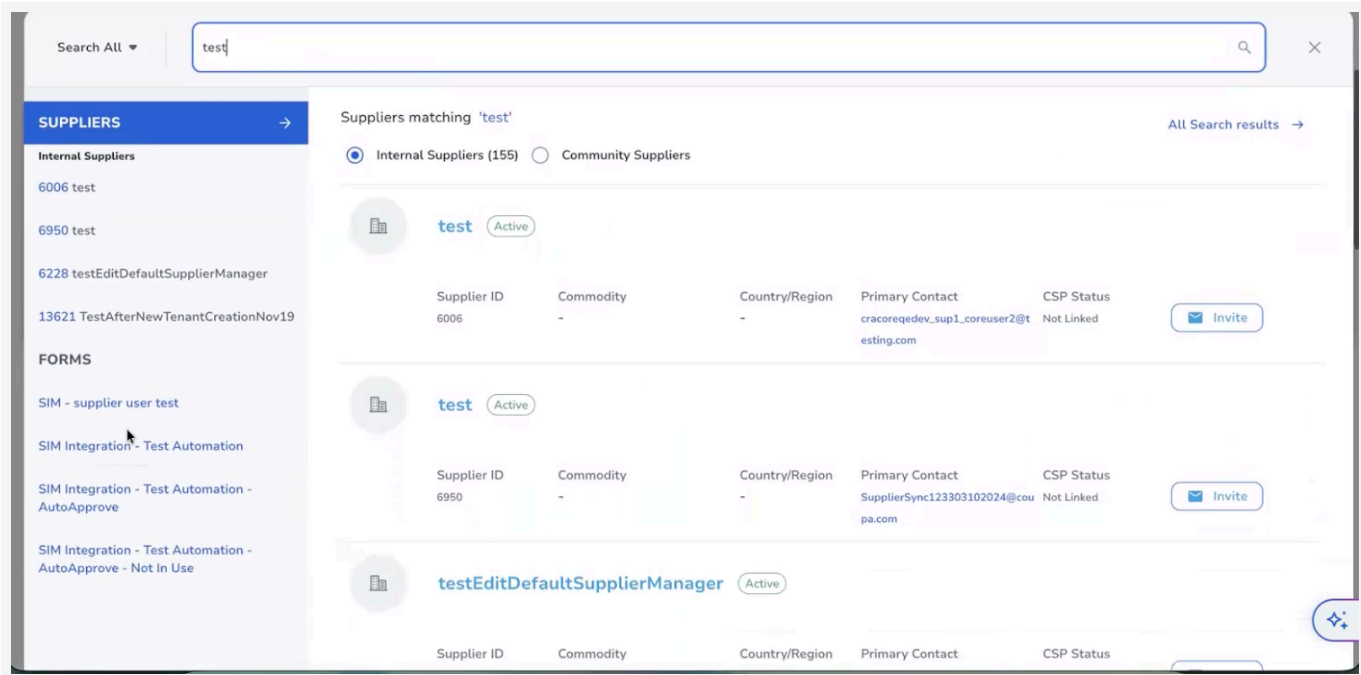

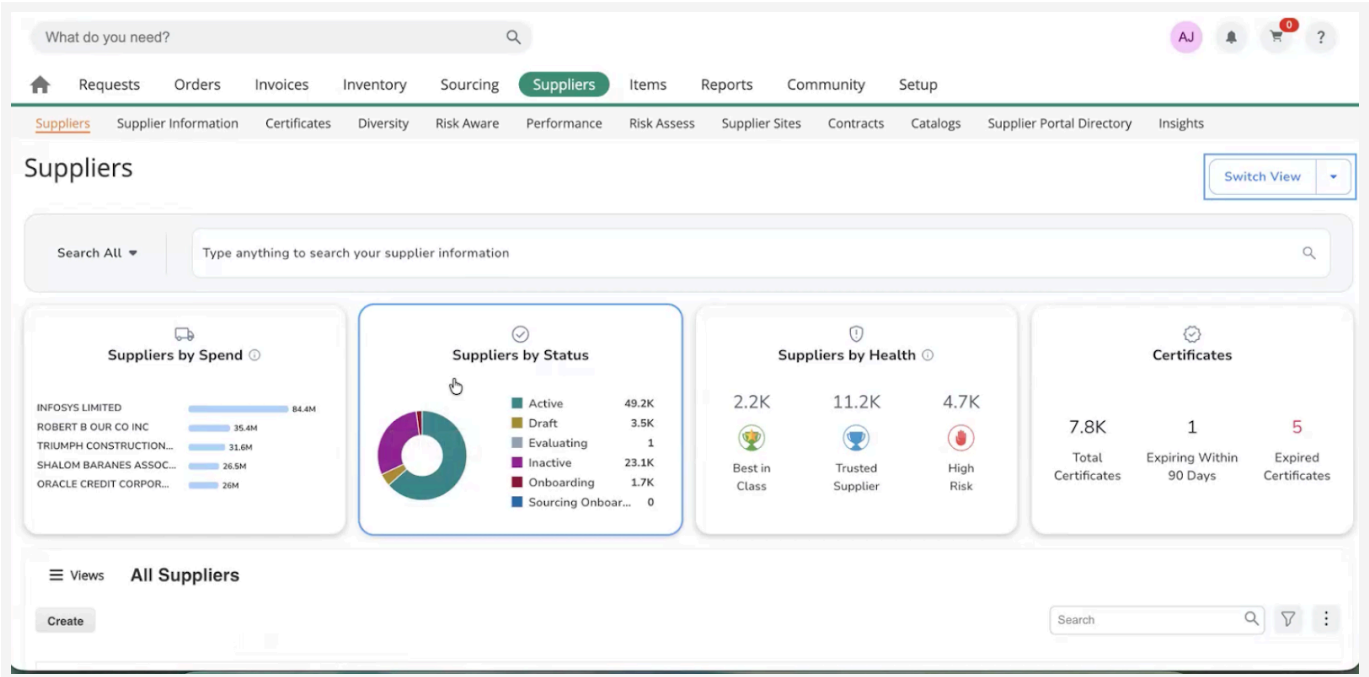

Figure 21. Dashboard and widgets in the Suppliers page

Each widget is presented in a tile with corresponding insights about all suppliers the users have access to.

Table view with filtered results

Depending on the widget selected, the table view below changes, portraying the list of suppliers with relevant information related to that widget. This table includes its own searchbar to filter among the selected suppliers.

Customize the entire Suppliers page

You can change the way the dashboard looks by selecting the **Switch View** option on the top right, where they can select from the **Classic Experience**, **New Experience** (to be removed soon), and **Supplier Dashboard Experience** (current).

For more information, see the following pages:

- [Suppliers Dashboard](#)

Increase Visibility into Escalated Workbench Tasks

Escalate unresolved Workbench task to additional assignees and ensure timely task resolution.

With escalations, an additional responsible user is assigned to a Workbench task when a primary assignee fails to act on it within a specified timeline.

To configure escalations, navigate to **Setup**→**Task Configurations** and select a task type to edit. In the **Step 4: Reminders and Escalations** section, select the user or user group and set the timelines.

On the Workbench, tasks with escalations feature a rocket icon with a number indicating how many escalations have occurred. This icon is visible in both the task list and task details sections. Hover over the icon to see specific details, including the person the task was escalated to and the date.

Escalated tasks contribute to your global Workbench tasks count, ensuring they are immediately visible as pending work. If you are an escalatee without permissions to take direct action on a task, you can use the comments framework to notify the relevant team members.

Users with the appropriate permission can visit the **Task Management** page to see which escalatees are associated with a particular task through the **Escalated To** column or filter the list with **Escalated** view.

For more information, see [Workbench Tasks](#).

Roles and permissions

None.

Integrations

Coupa Navi Agent Portfolio Expansion

Learn about the new and enhanced Coupa Navi™ agents.

Coupa Navi™ (Navi) has new and enhanced conversational agents and new autonomous agents

The table below lists the new and enhanced conversational agents.

Application	Agent	Enhanced or New	Description
Contract Intelligence	Negotiation Playbook	New	Helps you accelerate contract negotiations and reduce legal dependencies by applying structured, AI-driven playbook guidance directly to your agreements. Off by default. Controlled by the Enable Negotiation Playbook checkbox on the Setup→Company Information page. Contract Playbooks controller added to the Admin and Contract Negotiator roles. For more information, see Roles and permissions. For more information, see Negotiation Playbook.

Application	Agent	Enhanced or New	Description
Coupa Advanced Analytics	Analytics Agent	Enhanced	Allows you to access embedded spend analytics and AI-driven insights through Navi directly on the Supplier 360 page, enabling you to make data-driven decisions without leaving your current workflow. Off by default. While the Analytics agent is generally available, this feature is available only as part of the Early Access Program (EAP). For more information, see Embedded Analytics in Supplier 360.
Coupa Core Platform	Knowledge Agent	Enhanced	Enhanced to use your uploaded knowledge documents and show relevant links from your buying policies and other documents directly in responses.

Application	Agent	Enhanced or New	Description
			While the Knowledge Agent is on by default, this enhancement is off by default. Controlled by the Knowledge Agent: Allow Navigation to respond with Knowledge Hub checkbox on the Setup→Company Information page. For more information, see Answer Questions with Knowledge Agent. The Knowledge Agent is available also with Treasury Management. For more information, see the <i>Treasury Management</i> row below.
Coupa Core Platform	Operational Reporting Agent	Enhanced	Enhanced to provide information on applied filters and explanation when returning a response. For more information, see Create and Edit Table

Application	Agent	Enhanced or New	Description
			Views with Operational Reporting Agent.
Coupa Sourcing	Sourcing Supplier Recommendation Agent	New	Identify and short-list relevant suppliers for your sourcing events based on category, region, and past performance, using the Sourcing Supplier Recommendation agent. Off by default. Controlled by the Enable Sourcing Supplier Recommendations Agent (Limited Availability) checkbox on the Setup→Company Information page. For more information, see Discover Suppliers with the Sourcing Supplier Recommendations Agent
Coupa Sourcing	Supplier Response Comparison Agent	Enhanced	Enhanced to evaluate bids based on supplier profile cri-

Application	Agent	Enhanced or New	Description
			teria, evaluator analysis, and offline attachments. Additionally, get insights into supplier risk, sustainability, diversity, and evaluator scores. Off by default. Controlled by the Enable Supplier Response Comparison Agent (Limited Availability) checkbox on the Setup→Company Information page. For more information, see Skill Enhancements to the Supplier Response Comparison Agent.
Coupa Sourcing Optimization	Sourcing Optimization Event Creation Agent	Enhanced	Enhanced to allow uploading one or multiple Excel files and automatically extract data and configure your sourcing optimization events. Off by default. Controlled by the Enable Sourcing Op-

Application	Agent	Enhanced or New	Description
			timization Event Creation Agent (Limited Availability) checkbox on the Setup→Company Information page. For more information, see File Upload Enhancements to the Sourcing Optimization Event Creation Agent.
Procurement	Request Creation Agent	Enhanced	Enhanced to include guided buying capabilities to help you purchase what you need through chat, without having to navigate for the appropriate request form. Off by default. Controlled by the Enable Request Creation Agent checkbox on the Setup > Company Information page. For more information, see Other Services Procurement

Application	Agent	Enhanced or New	Description
			Enhancements and Convert Contracts to Requests with Request Creation Agent .
Risk Aware	Sanctions Risk Agent	New	Screens suppliers against global sanctions lists, helping you identify potential supplier risk. Supports the Supplier Onboarding Agent. Off by default. Controlled by the Enable Sanctions Risk Agent (Limited Availability) checkbox on the Setup > Company Information page. Permissions added to the Coupa Navi User role. For more information, see Roles and permissions. For more information, see Sanctions Risk Agent.

Application	Agent	Enhanced or New	Description
Risk Aware	Supplier Risk Profile Agent	New	Generates risk profiles to provide insights into supplier performance and potential risk. Off by default. Controlled by the Enable Supplier Risk Profile Agent (Limited Availability) on the Setup > Company Information page. Permissions added. For more information, see Roles and permissions. For more information, see Supplier Risk Profile Agent.
Supplier	Supplier Discovery Agent	Enhanced	Improved the view with more information about each supplier, including the options to visit the supplier profile page and onboard suppliers directly from the Navi chat window. Supports the Supplier Onboarding

Application	Agent	Enhanced or New	Description
			Agent. Off by default. Controlled by the Enable Supplier Discovery Agent (Limited Availability) checkbox on the Setup > Company Information page. For more information, see Supplier Discovery Agent Enhancements.
Supplier	Supplier Onboarding Agent	New	Helps onboard suppliers discovered through Navi in the same window, matching the corresponding onboarding flow and pre-filling the required forms before reviewing and sending for approval. Supported by the Supplier Discovery Agent and the Sanctions Risk Agent. Off by default. This agent is available

Application	Agent	Enhanced or New	Description
			only as part of the Early Access Program (EAP). For more information see: Light-weight Supplier Onboarding in Navi .
Supply Chain Design and Planning	Supply Chain Modeling Agent	Enhanced	Supports Green-field Analysis, Inventory Optimization, and Transportation Optimization and runs scenarios from the Navi prompt. Off by default. For more information see: Navi Modeling agent support for additional technologies and Running scenarios from the Navi chat
Treasury Management	Knowledge Agent	Enhanced	While not a dedicated Treasury agent, the Knowledge Agent is available also with Treasury Management.

Application	Agent	Enhanced or New	Description
			For more information, see Coupa Navi introduced for Treasury Management and Answer Questions with Knowledge Agent .

The table below lists the new and enhanced autonomous agents. For more information, see [Coupa Navi Agent Studio](#).

Agent	Enhanced or New	Description
Autonomous Supplier Fragmentation Opportunity Agent	New	Detects supplier fragmentation spend opportunities.
Supplier Document Readiness Agent	New	Extracts data from supplier-uploaded documents, compares them against the buyer's supplier record, and presents any discrepancies found. For more information, see Automatically Compare Mismatches in Supplier Records .

For more information, see [Coupa Navi](#).

- [New controllers](#): Contract Playbooks, Supplier - Document Agent Configuration

- [Updated controllers](#): Coupa Navi Permissions Anchor
- [API-specific permissions](#): AI Agent: Internal API for Supplier Risk

Integrations

None.

Availability

NOTE: Navi is now available to you if you are a HIPAA customer. If you are a FedRamp customer, Navi is not available to you.

Coupa-created agents are available with Navi as part of the Coupa Core Platform and require the relevant applications: Coupa Advanced Analytics, Coupa Contract Intelligence with Contract Lifecycle Management Advanced (CLMA), Coupa Sourcing, Procurement, Risk Aware, or Treasury Management.

To use Coupa Sourcing Optimization agents, you need to have Coupa Sourcing Optimization with the Coupa Core Platform.

To use Supply Chain Design and Planning agents, you need to have Supply Chain Design and Planning with or without the Coupa Core Platform.

Some agents are off by default and configurable.

Some features of some conversational agents and all the autonomous agents are available with Coupa Navi Agent Studio as part of the [Early Access Program \(EAP\)](#). They are off by default. For more information, see [Coupa Navi Agent Studio Enhancements](#).

This product consumes AI credits. For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

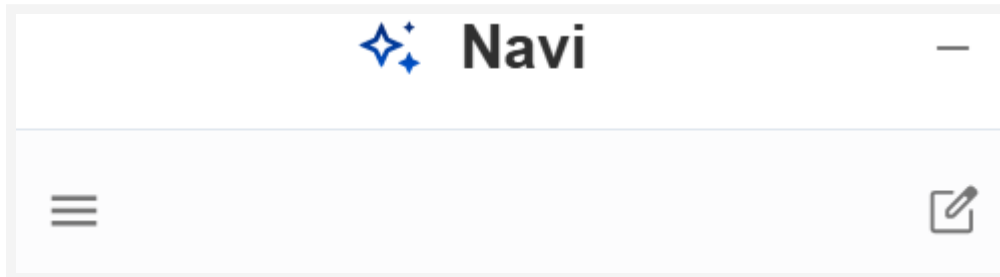

Release Note Changes

None.

Coupa Navi User Experience Enhancements

Learn about the changes in the Coupa Navi™ user experience, for example, threaded conversations and conversation history.

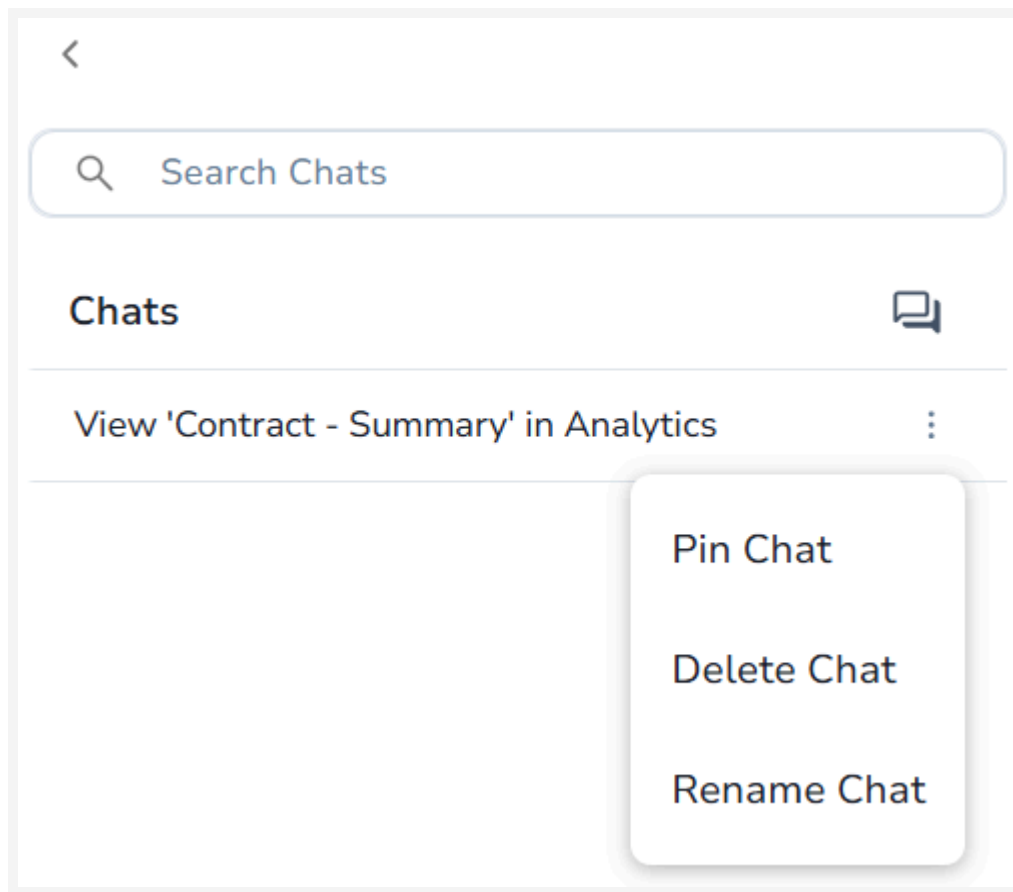

The Coupa Navi™ (Navi) chat window has an updated header and options to start new and manage previous conversations.

Selecting the **Create** (pencil and paper) icon on the right clears your current conversation and its context and starts a new chat.

Each conversation is saved with the first prompt as the title.

Selecting the **Menu** (hamburger) icon on the left opens your conversation history allowing you to find and resume a previous conversation or pin, delete, or rename a chat.

Your conversations are stored for 30 days.

You can copy your plain text conversations from the Navi chat window to your clipboard.

For more information, see [Start Working with Coupa Navi](#).

Roles and permissions

None.

Integrations

None.

Availability

These enhancements are available with Navi as part of the Coupa Core Platform.

This product consumes AI credits. For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

Release Note Changes

None.

Embedded Analytics in Supplier 360

Access embedded spend analytics and AI-driven insights through Coupa Navi™ directly on the Supplier 360 page to make data-driven decisions without leaving your current workflow.

You can use Navi's Analytics Agent directly from the **Supplier 360** page to access embedded spend visualizations, including commodity, regional, and alternative supplier insights.

The **Spend Trend** section shows a bar chart with your spend trend amount and the percentage of your and community's disputed invoices by month.

Selecting **Analyze Further** opens the Navi chat window allowing you to perform a deeper, AI-driven drill-down analysis. You can enter your prompt or choose from the following options:

- Top 5 Commodity by Spend
- Breakdown by Region
- Breakdown by Commodity
- Spend with Alternative Suppliers
- Top 10 Alternative Suppliers by Region

NOTE: Opening the Navi chat window from the Coupa Navi™ icon doesn't give you the same results.

For more information, see the following pages:

- [Embedded Analytics in Supplier 360](#)
- [Supplier 360](#)
- [Coupa Navi](#)

Roles and permissions

None.

Integrations

None.

Availability

This feature is available only for customers that participate in the [Early Access Program \(EAP\)](#). If you want to be an EAP customer, contact your Coupa representative.

For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

Release Note Changes

None.

Coupa Navi Agent Studio Enhancements

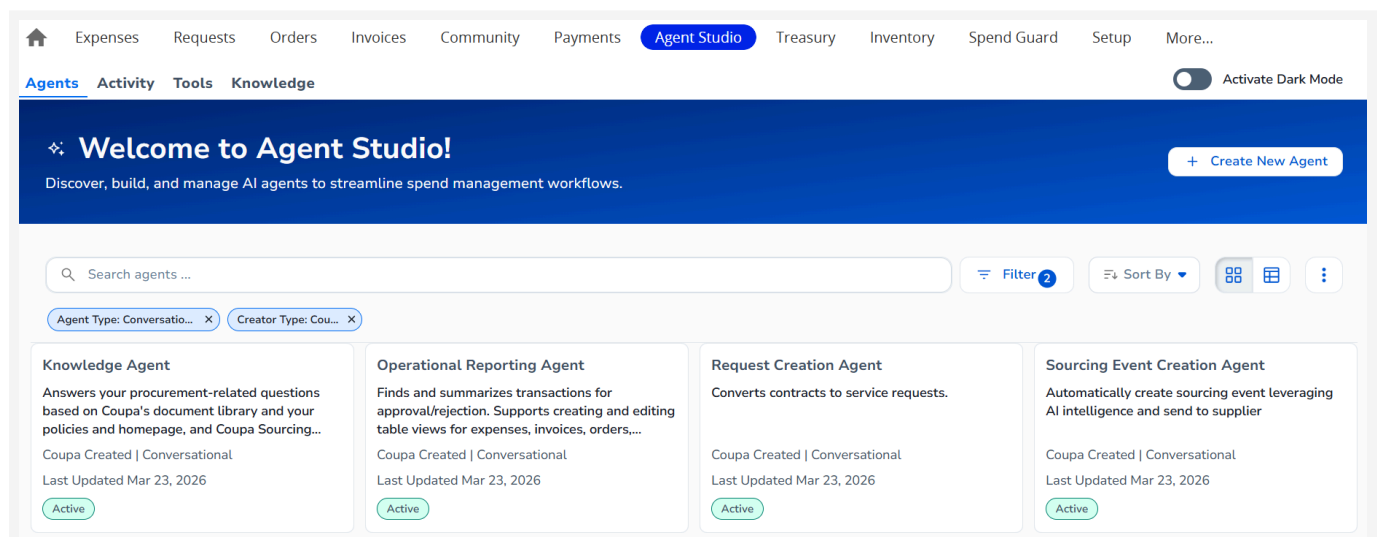

Use Agent Studio's guided Navi Assist workflow to build custom agents with company-specific knowledge.

The Agent Studio directory contains new and enhanced conversational and autonomous agents. For more information, see [Coupa Navi Agent Portfolio Expansion](#).

On the **Setup**→**Company Information** page, selecting the **Enable generative AI for platform capabilities** checkbox allows viewing Agent Studio. Selecting the **Enable Agent Studio Builder** checkbox allows creating new agents in Agent Studio.

You can also enable or disable agents directly from Agent Studio by filtering for status (inactive, active, or draft), agent type (autonomous or conversational), and creator type (Coupa or custom).

In addition to sorting the agents (by name, description, status, creator, version, and last updated date) and searching for them (based on name and description), you can now also switch between grid view and list view and export the agents as CSV or XLSX.

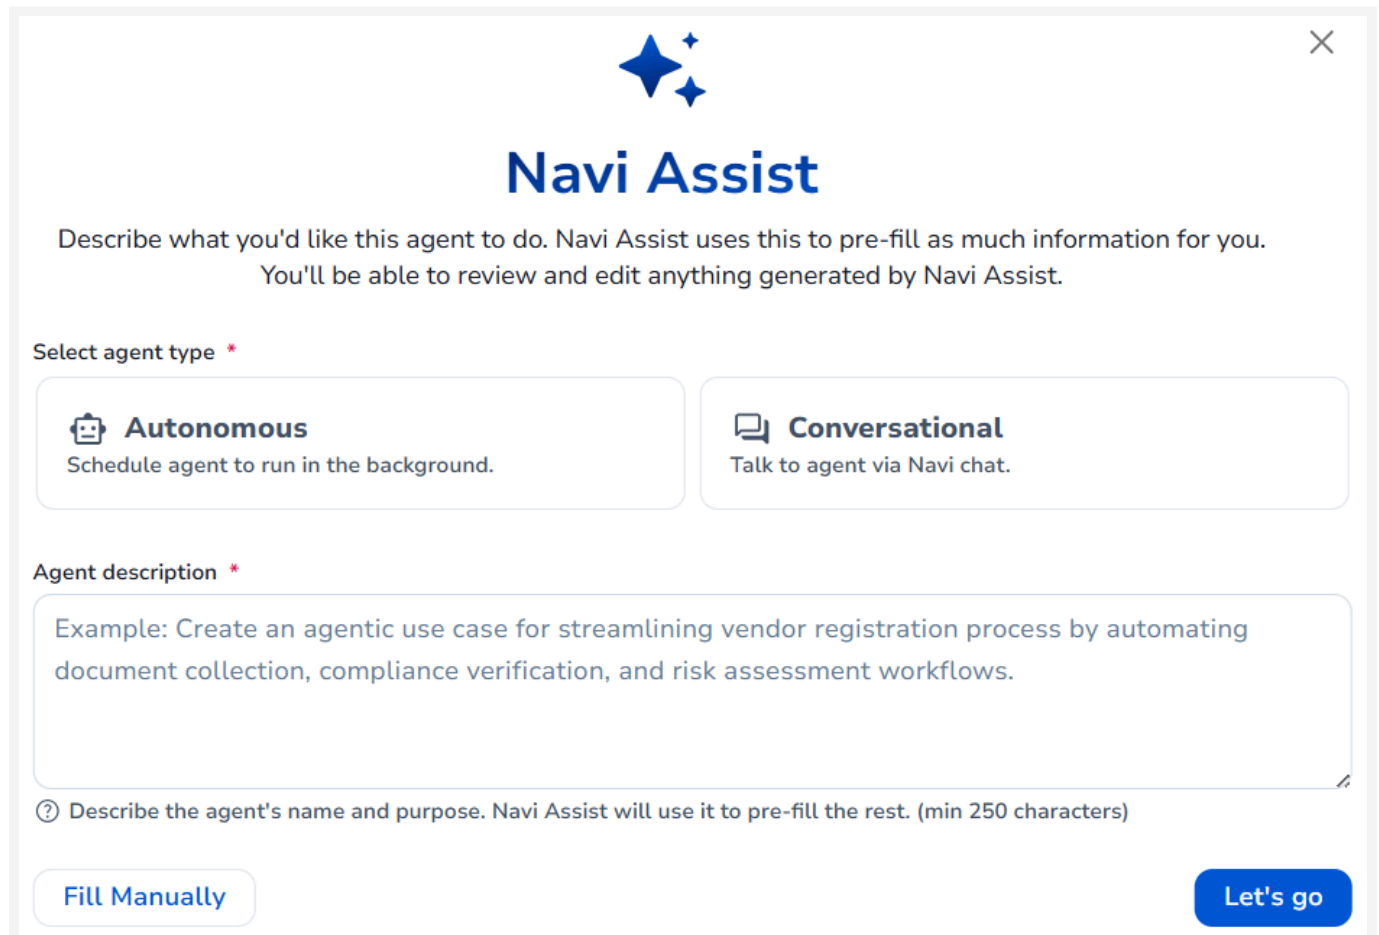

Selecting an agent card navigates to the corresponding agent profile page showing the following information: name, status, description, version, last updated by, last update on, agent type, model, creator, and, in case of custom agents and Coupa-created autonomous agents, also the agent definition.

The agent definition consists of agent configuration (expertise, guardrails, and instructions), knowledge, agents, and triggers.

The agent definition is not available for Coupa-created conversational agents. However, similarly to the other agents, you can test them before deciding to activate them.

NOTE: Agent Studio is available also in dark mode, allowing for a more comfortable viewing experience in a low-light environment.

When you select the **Create New Agent** button, the **Navi Assist** dialog opens for you to choose the type of agent that you want to create and provide its description.

The image shows a 'Navi Assist' dialog box with a blue star icon at the top center. Below the icon, the title 'Navi Assist' is displayed in a large blue font. A descriptive paragraph states: 'Describe what you'd like this agent to do. Navi Assist uses this to pre-fill as much information for you. You'll be able to review and edit anything generated by Navi Assist.' Below this, there is a section titled 'Select agent type *' with two options: 'Autonomous' (with a robot icon and the subtext 'Schedule agent to run in the background.') and 'Conversational' (with a chat bubble icon and the subtext 'Talk to agent via Navi chat.'). Underneath is a section titled 'Agent description *' with a text area containing an example: 'Example: Create an agentic use case for streamlining vendor registration process by automating document collection, compliance verification, and risk assessment workflows.' Below the text area is a question mark icon and the text: 'Describe the agent's name and purpose. Navi Assist will use it to pre-fill the rest. (min 250 characters)'. At the bottom left is a 'Fill Manually' button, and at the bottom right is a blue 'Let's go' button.

If you select **Let's Go**, Navi fills in the required fields for the agent definition that you can update. After the agent definition, you can provide the optional agent setup information before testing and activating your agent.

The agent setup information includes the knowledge (documents with company-specific information), agents (other agents to support your new agent's workflow), and tools (APIs or Coupa actions to expand your agent's capabilities). In case of autonomous agents, you can also provide triggers to determine the frequency, date, and time when the agent should run). In case of conversational agents, you can also add sample queries to determine if the agent should be activated with the other conversational agents.

All available knowledge documents and tools are visible on the **Knowledge** and **Tools** tabs.

Selecting the **Knowledge Agent: Allow Navi to respond with Knowledge Hub** checkbox on the **Setup→Company Information** page allows Agent Studio and Navi's Knowledge Agent to use your uploaded company-specific documents.

For more information, see [Coupa Navi Agent Studio](#) and [Answer Questions with Knowledge Agent](#).

Roles and permissions

- [New system roles](#): Agent Studio - User
- [Updated controllers](#): AI Agents

Integrations

None.

Availability

This feature is available only for customers that participate in the [Early Access Program \(EAP\)](#). If you want to be an EAP customer, contact your Coupa representative.

This product consumes AI credits. For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

Except for the Document Discovery Agent, Knowledge Agent, and Operational Reporting Agent, Coupa-created agents that are generally available as part of this product consume AI credits. As part of the EAP, agents that you create do not consume AI credits.

Release Note Changes

None.

Supplier Discovery Agent Enhancements

Buyers searching for suppliers in Coupa Navi™ (Navi) see an improved view with more information about each supplier, including the options to see the full supplier profile page and onboard suppliers directly from the chat window.

You can ask the Navi Supplier Discovery Agent about the suppliers that you need, including the criteria you want to search. In the same chat window, Navi will show the first results combining internal suppliers (already linked to your account) and Community suppliers (registered in Coupa).

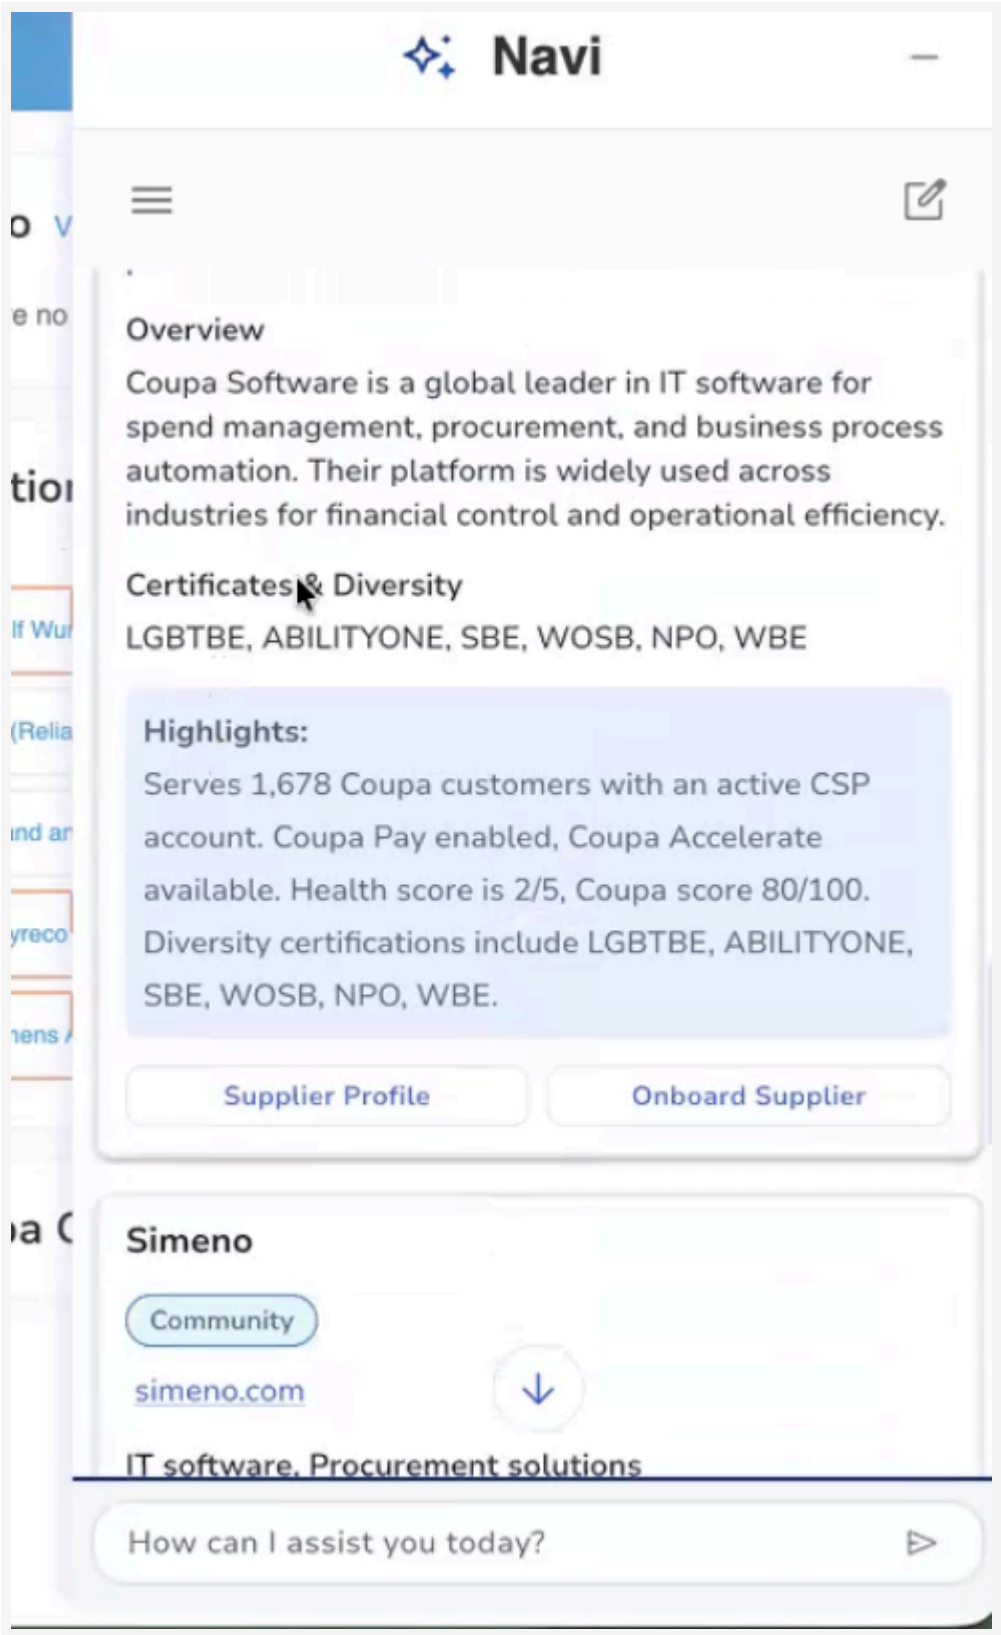

Each result presents:

- Overview of the supplier
- Certificates and diversity information
- Highlights
- Optional **Onboard Supplier** button.

For more information about onboarding suppliers in Navi, see [Lightweight Supplier Onboarding in Navi](#).

- Optional **Supplier Profile** button.

Figure 24. Improved results view

Cross-agent collaboration

This agent supports the **Supplier Onboarding Agent** (which identifies the right business process to onboard the supplier, and presents the correct form), and the **Sanctions Risk Agent** (reviews if the supplier in question is in any sanctioned list).

For more information, see:

- [Find Suppliers with Supplier Discovery Agent](#).
- [Lightweight Supplier Onboarding in Navi](#).

Roles and permissions

None.

Integrations

None.

Availability

This feature is part of the Total Spend Management Platform. It is on by default.

For more information on Coupa AI, see the [AI Trust Center](#), [AI Credits](#), and [Coupa Artificial Intelligence Documentation](#).

Release Note Changes

None.

QuickFlow Configuration

See the features added to QuickFlow Configuration for the May 2026 Release (R45).

Introducing Quickflow Configuration

Set up your system faster using guided configuration workflows in a centralized workspace. Reduce implementation time by completing key setup tasks with structured, in-product guidance.

Configure and deploy the Coupa platform using in-product guidance instead of implementation services. As an administrator, you can complete setup activities through structured experiences that help load essential data, define system settings, and track overall progress.

QuickFlow Configuration organizes the early stages of deployment into guided setup activities. Use these tools to access configuration tasks from a central workspace, complete guided workflows for common setup tasks, import essential data, and track setup progress. This approach streamlines system setup, reduces the time required to prepare the platform for operational use, and provides clear visibility into the steps needed to complete deployment.

Table 4.QuickFlow Configuration components

Component	Description
Admin Center	Central workspace to access setup tasks, launch workflows, and track overall configuration progress. For more information, see Admin Center.
Setup Workflows	Guided, step-by-step workflows for completing configuration tasks. For more information, see Setup Workflows.
CSV Imports	CSV upload and field mapping capabilities to import records in bulk. For more information, see Import Data Using CSV Files.

Roles and permissions

None.

Integrations

None.

Availability

This feature is part of QuickFlow Configuration. It is on by default.

Release Note Changes

None.

Coupa Supplier Portal

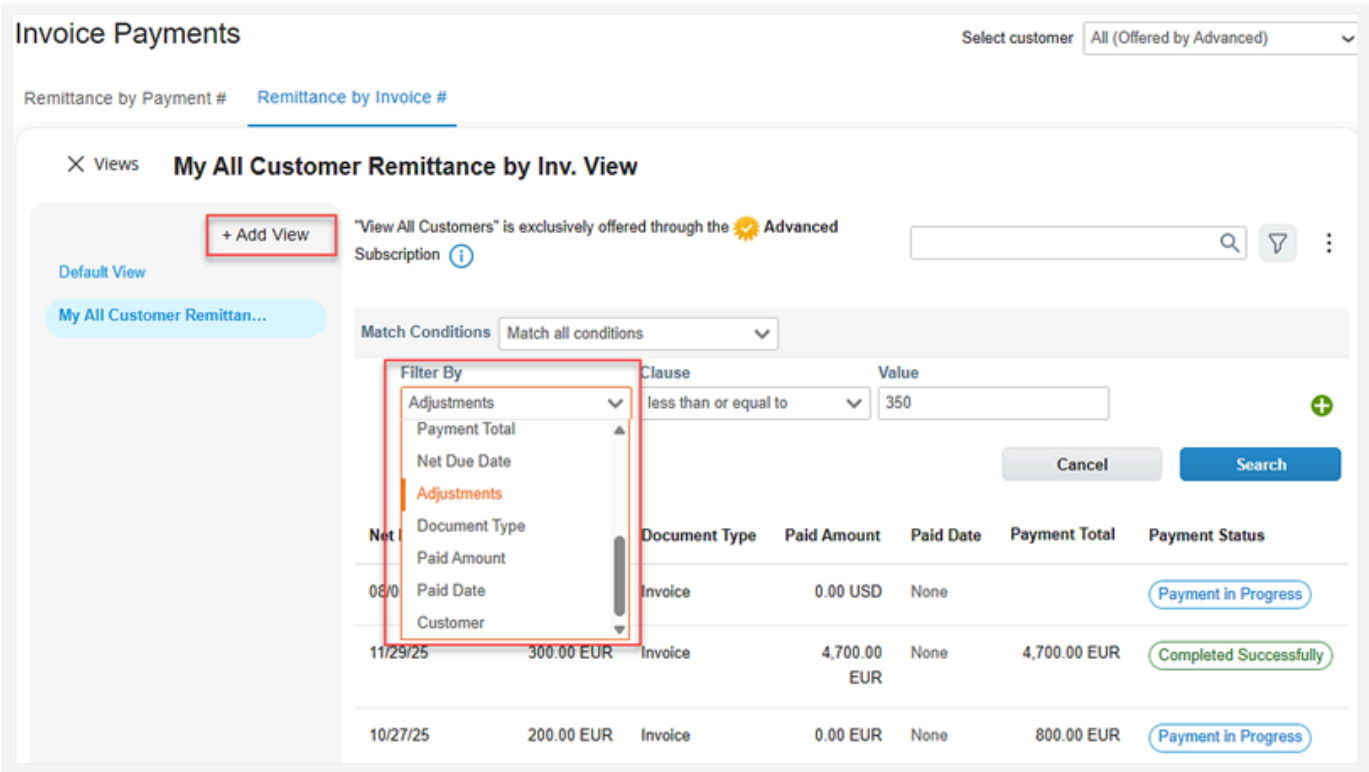

See the features added to Coupa Supplier Portal for the May 2026 Release (R45).

Custom Views and More Filters for Customer Payments Data in the CSP

Your suppliers in the Coupa Supplier Portal (CSP) can now create custom views from the strategic All Customer views for payments data. They also have additional fields for expanded filtering and custom views from the Invoice Payments screen.

Suppliers with the Advanced subscription to the CSP have access to strategic views into customer payments data across all buyers for which they have permissions. Now they can create custom views from the **All Customers** strategic views from the **Invoice Payments** and **PO Payments** data tables.

This is the same functionality Advanced subscribers already have for their **Invoices** and **Orders** on the CSP, giving suppliers a more consistent and flexible workflow in the CSP user interface.

The **All Customers** table view from **Invoice Payments** also has more fields for filtering and creating custom views. The fields that suppliers can use vary depending on whether they view the table with the **Remittance by Payment #** or **Remittance by Invoice #** tab.

Based on the tab view, the following new fields are available:

- **Net Due Date**

- **Adjustments**
- **Document Type**
- **Paid Amount**
- **Paid Date**

This means your suppliers can capture more detail from invoice payments across all buyers when they use the **Export as CSV Plain Text (Current Columns)** function from the filtered data table.

For more information, see [View and Manage Payments](#) and [Coupa Advanced](#) in the CSP Documentation.

Roles and permissions

None.

Integrations

None.

Availability

This feature is part of the Coupa Supplier Portal (CSP). It is on by default only for suppliers with the Advanced subscription and with the **Payments** permission in the CSP, and is configurable.

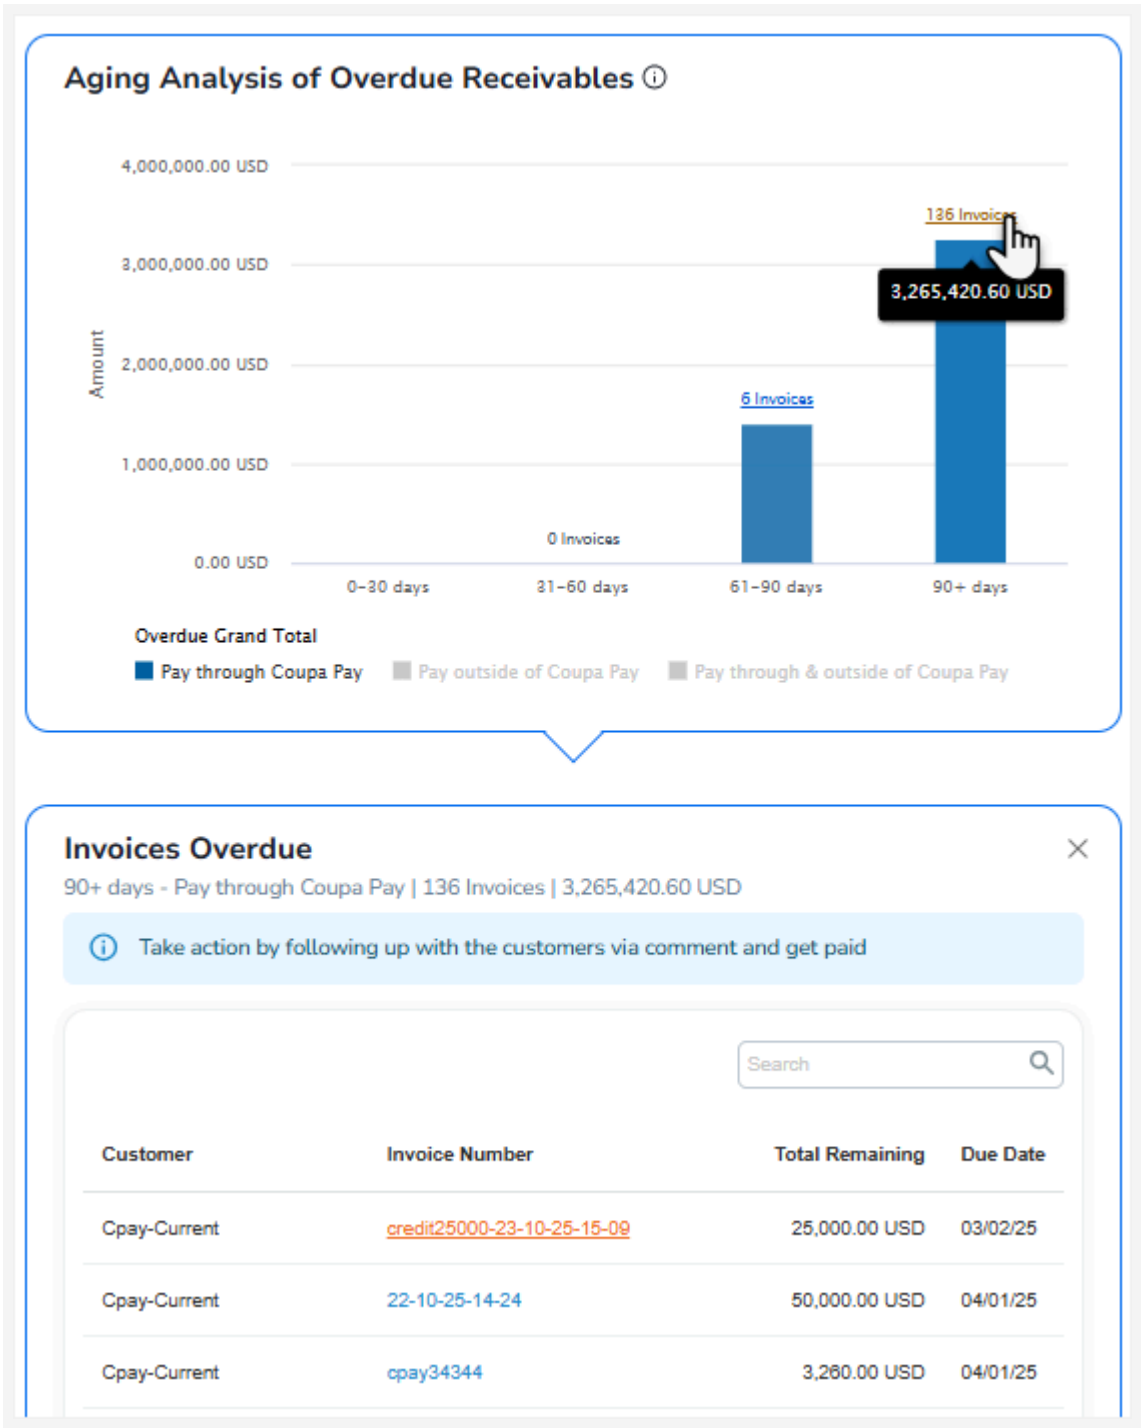

Release Note Changes

None.

Supplier Dashboard adds Actionable Insights for Overdue Receivables

Suppliers can access overdue invoices to follow up with buyers directly from the Supplier Dashboard in the Coupa Supplier Portal (CSP).

Suppliers with the Advanced subscription to the CSP have access to the **Supplier Dashboard** and strategic views into customer payments data across all buyers for which they have permissions. This includes both buyers that pay through Coupa Pay and outside of Coupa Pay. From the enhanced dashboard, suppliers can now drill directly into their overdue invoices from the **Aging Analysis of Overdue Receivables** section. Selecting the number of invoices above the bar graph for an aging bracket opens the **Invoices Overdue** table, with all overdue invoices and credit notes sorted by the earliest due date. The table has a search function, and suppliers with the proper permissions can click the invoice number to open the detail view and leave a comment for a buyer, if necessary.

For more information, see [Supplier Dashboard](#) and [Coupa Advanced](#) in the CSP Documentation.

Roles and permissions

None.

Integrations

None.

Availability

This feature is part of the Coupa Supplier Portal (CSP). It is on by default only for suppliers with the Advanced subscription and with the **Supplier Dashboard** and **Payments** permissions in the CSP, and is configurable.

Release Note Changes

None.

Roles and Permissions Updates

See the changes made to roles and permissions in the May 2026 Release (R45).

New System Roles

See the new system roles added in the May 2026 Release (R45).

The following list shows the new system roles. System roles grant access to various features and applications. If you are not familiar with roles, see [Understanding Roles and Permissions](#).

May 2026 Release (R45) new system roles

All roles listed below are added unless stated otherwise.

Control Tower Admin

Added as part of [Control Tower](#).

Permission	Controller	Action
signals / dismiss	Signals	Dismiss
control_tower / edit	Control Tower	Edit
control_tower / index	Control Tower	Index
signal_configurations / toggle	Signal Configurations	Toggle

Control Tower User

Added as part of [Control Tower](#).

Permission	Controller	Action
signals / dismiss	Signals	Dismiss
control_tower / edit	Control Tower	Edit
control_tower / index	Control Tower	Index

Services Procurement Admin

Added as part of [Simpler Configuration for Services Procurement](#).

Permission	Controller	Action
services_procurement/settings / index	Services Procurement Settings	Index

Permission	Controller	Action
services_procurement/set- tings / update	Services Procurement Set- tings	Update

Updated System Roles

See the changes made to system roles in the May 2026 Release (R45).

The following list shows the updated system roles. Each new release adds new permissions to system roles. If you have created custom roles based on a system role, check the new permissions added to it. If you are not familiar with roles and permissions, see [Understanding Roles and Permissions](#).

May 2026 Release (R45) updated system roles

All permissions listed below are added to the system roles unless stated otherwise.

Permission	Controller	Action	Feature
ance_form_re- sponses / manual- ly_assign	Form Responses		44.1.0

Updated Custom Roles

See the changes made to custom roles in the May 2026 Release (R45).

To ensure that your custom roles continue to behave as expected after an upgrade, sometimes permissions are added to your custom roles as part of the upgrade migration. This is to maintain existing functionality for a custom role, for example, during a permission split. New functionality is never added to your custom role.

Permission-based migrations

The following table shows which permissions drive a new permission to be added to your custom roles. If your custom roles have any of the permissions listed in the left-hand column, they get the permissions in the middle column.

May 2026 Release (R45) updated custom roles

If your custom role has this permission	Your custom role automatically gets these permissions	Feature
Invoices/Void	Invoices/Void Approved, Invoices/Void Paid	Resolved issue in 45.0.0
Items/Add supplier item	Items/Edit supplier item, Supplier Items/Edit supplier item price, Supplier Items/Edit supplier item contract	More Precise Control Over Item Access
Supplier cXML Request Monitors/Index	Supplier cXML Request Monitors/cXML Request Order Confirmation, Supplier cXML Request Monitors/Order Confirmation Show, Supplier cXML Request Monitors/Search Order Confirmation cXML Request Table	Order Confirmation cXML Errors Visible on CSP
User/Home	API/Landed Cost	Future functionality

New Controllers

See the new controllers added in the May 2026 Release (R45).

The following list shows the new controllers. It is organized by controller, showing each new action and the feature that introduced the new action. If you are not familiar with controllers, actions, and permissions, see [Understanding Roles and Permissions](#).

May 2026 Release (R45) new controllers

Contract Playbooks

Permission	Action	Description	Feature
contract_playbooks / analyze	Analyze	Trigger playbook analysis	Negotiation Playbook
contract_playbooks / manage	Manage	Create, edit, activate/deactivate playbooks	Negotiation Playbook
contract_playbooks / view	View	View playbook library	Negotiation Playbook

Control Tower

Permission	Action	Description	Feature
control_tower / edit	Edit	Control Tower configuration page	Control Tower
control_tower / index	Index	Control Tower index	Control Tower

Coupa Navi - Access (Navi Assistant)

Permission	Action	Description	Feature
Coupa Navi - Access / Coupa Navi - Access (Navi Assistant / Navi Token)	Coupa Navi - Access (Navi Assistant)	Permission allows Core to allow a user to access Navi Chatbot	Resolved issue in 45.0.0

Document Validation Config

Permission	Action	Description	Feature
document_validation_config / manage	Manage	Manage document validation configuration including field criticality and confidence threshold	Automatically Compare Mismatches in Supplier Records

DORA Compliance

Permission	Action	Description	Feature
dora_compliance / edit_contract_fields	Edit Contract Fields	Edit DORA Contract Fields	Future functionality
dora_compliance / view_contract_fields	View Contract Fields	View DORA Contract Fields	Future functionality

Quotes/bid summary

Permission	Action	Description	Feature
quotes/bid_summary / index	Index	View Bid Summary on Sourcing events	Evaluate Sourcing Events with the Comparative Bid Report

Services Procurement Settings

Permission	Action	Description	Feature
services_procurement/settings / index	Index	Can view all services procurement	Simpler Configuration for Services

Permission	Action	Description	Feature
dex		settings	Procurement
services_procurement/settings / update	Update	Can update all services procurement settings	Simpler Configuration for Services Procurement

Shipment Tracking

Permission	Action	Description	Feature
shipment_tracking / setup	Setup	Allows access to the Shipment Tracking setup configuration page for managing carrier account details	Future functionality

Signal Configurations

Permission	Action	Description	Feature
signal_configurations / toggle	Toggle	Toggle Signal Configurations	Control Tower

Signals

Permission	Action	Description	Feature
signals / dismiss	Dismiss	Dismiss Signals	Control Tower

Supplier - Document Agent Configuration

Permission	Action	Description	Feature
supplier_discrepancy / view	View	To control access to the Document Validation widget	Automatically Compare Mismatches in Supplier Records

Supplier Business Profile Requests

Permission	Action	Description	Feature
supplier_data_requests / index	Index	View Supplier Business Profile Request Records	Suppliers Tasks in the Workbench
supplier_data_requests / search_supplier_data_request_table	Search Business Profile Requests Table	Search in Supplier Data Requests Table	Suppliers Tasks in the Workbench
supplier_data_requests / supplier_data_request_list_csv	Business Profile Requests List CSV	Download CSV Template / Data for Supplier Business Profile Requests	Suppliers Tasks in the Workbench

Supplier Worker Assignment Changes

Permission	Action	Description	Feature
worker_assignment/supplier_worker_assignment_changes / index	Index	Allow CSP users to view worker assignment changes lists	Worker Assignment Approvals

Permission	Action	Description	Feature
worker_assignment/supplier_worker_assignment_changes / search_worker_assignment_change_table	Search Worker Assignment Change Table	Required to search list	Worker Assignment Approvals
worker_assignment/supplier_worker_assignment_changes / show	Show	Allow CSP users to view the worker assignment change	Worker Assignment Approvals
worker_assignment/supplier_worker_assignment_changes / withdraw	Withdraw	Required to withdraw a pending change request	Worker Assignment Approvals
worker_assignment/supplier_worker_assignment_changes / worker_assignment_change_list_csv	Worker Assignment Change List CSV	Required to export list	Worker Assignment Approvals

Worker Assignment Changes

Permission	Action	Description	Feature
worker_assignment/worker_assignment_changes / add_approver	Add approver	Required to add approvers and watchers	Worker Assignment Approvals

Permission	Action	Description	Feature
worker_assignment/worker_assignment_changes / approve	Approve	Required to approve	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / bypass_approvals	Bypass approvals	Required to bypass all approvals	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / bypass_current_approval	Bypass Current Approval	Required to bypass current approval	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / index	Index	Allow users to view worker assignment changes lists	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / reject	Reject	Required to reject	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / remove_approval	Remove approval	Allows current Ultimate Approver to remove themselves and regenerate pending approvals	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / remove_and_re-	Remove And Regenerate	Allows current approver to remove themselves and regenerate pending	Worker Assignment Approvals

Permission	Action	Description	Feature
generate		approvals	
worker_assignment/worker_assignment_changes / resend_approval_notifications	Resend Approval Notifications	Required to send approval notifications	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / search_worker_assignment_change_table	Search Worker Assignment Change Table	Required to search list	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / show	Show	Allow users to view the worker assignment change	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / withdraw	Withdraw	Required to withdraw a pending change request	Worker Assignment Approvals
worker_assignment/worker_assignment_changes / worker_assignment_change_list_csv	Worker Assignment Change List CSV	Required to export list	Worker Assignment Approvals

Updated Controllers

See the changes made to controllers and actions in the May 2026 Release (R45).

The following list shows the updated controllers. If you are not familiar with controllers, actions, and permissions, see [Understanding Roles and Permissions](#).

May 2026 Release (R45) updated controllers

Analytics

Permission	Action	Description	Feature
analytics / view_product_us- age	View Product Us- age	Allow user to view the Product Usage dashboards	Resolved issue in 44.4.0

Api/Comments

Permission	Action	Description	Feature
api/comments / add_watcher	Add watcher	Ability to add watcher	Resolved issue in 44.3.0

Bank Ready File Payment Batches

Permission	Action	Description	Feature
coupa_pay/ bank_ready_files/ payment_batches / withdraw	Withdraw	Withdraw Payment Batch from Ap- provals	Withdraw Submit- ted Payment Batch- es

Blacklisted Emails

Permission	Action	Description	Feature
blacklisted_emails / archive	Archive	Allows an admin to archive or unar- chive blacklisted emails	Resolved issue in 44.4.0

Confidential Bank Ready File Payment Batches

Permission	Action	Description	Feature
coupa_pay/confidential_bank_ready_files/payment_batches / withdraw	Withdraw	Withdraw Payment Batch from Approvals	Withdraw Submitted Payment Batches

Contracts

Permission	Action	Description	Feature
contracts / e-sign_resolution_options	E-Sign Troubleshooting	Allows users to troubleshoot e-sign issues by syncing status or uploading signed agreements to complete contracts stuck in pending signatures status	Resolved issue in 44.1.0

Coupa Navi Permissions Anchor

Permission	Action	Description	Feature
coupa_navi / onboard_supplier	Onboard Supplier	Coupa Navi - Onboard Supplier access	Lightweight Supplier Onboarding in Navi

Dynamic Markets API

Permission	Action	Description	Feature
api/dynamic_mar-	Cancel	Cancels the dy-	Resolved issue in

Permission	Action	Description	Feature
kets/markets / cancel		dynamic market	44.4.0
api/dynamic_markets/markets / create	Create	Creates the dynamic market	Resolved issue in 44.2.0
api/dynamic_markets/markets / destroy	Destroy	Deletes the dynamic market	Resolved issue in 44.2.0
api/dynamic_markets/markets / index	Index	List all the markets	Resolved issue in 44.2.0
api/dynamic_markets/markets / publish	Publish	Publishes the dynamic market	Resolved issue in 44.4.0
api/dynamic_markets/markets / send_to_rfx	Send to RFX	Flips dynamic market to a sourcing event	Resolved issue in 44.4.0
api/dynamic_markets/markets / show	Show	Fetches the dynamic market details	Resolved issue in 44.2.0
api/dynamic_markets/markets / update	Update	Updates the dynamic market	Resolved issue in 44.2.0

Dynamic Markets Suppliers API

Permission	Action	Description	Feature
dynamic_markets/	Create	Ability to add a	Resolved issue in

Permission	Action	Description	Feature
suppliers / create		Market Supplier	44.2.0
dynamic_markets/suppliers / search_supplier_table	Search supplier table	Ability to search Market Suppliers data table	Resolved issue in 44.2.0
dynamic_markets/suppliers / supplier_list_csv	Supplier list CSV	Ability to export Market Suppliers data table	Resolved issue in 44.2.0

Dynamic Markets Teams API

Permission	Action	Description	Feature
api/dynamic_markets/teams / create	Create	Adds a team member with role to the dynamic market	Resolved issue in 44.4.0
api/dynamic_markets/teams / destroy	Destroy	Removes a team member from the dynamic market	Resolved issue in 44.4.0
api/dynamic_markets/teams / index	Index	Lists team members in a dynamic market	Resolved issue in 44.4.0
api/dynamic_markets/teams / update	Update	Updates a team member linked to a dynamic market	Resolved issue in 44.4.0

Dynamic Markets/Suppliers

Permission	Action	Description	Feature
dynamic_markets/suppliers / create	Create	Ability to add a Market Supplier	Resolved issue in 44.2.0
dynamic_markets/suppliers / search_supplier_table	Search supplier table	Ability to search Market Suppliers data table	Resolved issue in 44.2.0
dynamic_markets/suppliers / supplier_list_csv	Supplier list CSV	Ability to export Market Suppliers data table	Resolved issue in 44.2.0

Email Transmissions

Permission	Action	Description	Feature
email_transmissions / search_csp_supplier_invitation_email_transmission_table	Search CSP Supplier Invitation Email Transmission Table	Allows a user to search the email transmissions data table for CSP supplier invitations	Future functionality
email_transmissions / csp_supplier_invitation_email_transmission_list_csv	CSP Supplier Invitation Email Transmission List CSV	A user can export CSP supplier invitation email transmissions data_table to CSV	Future functionality

Employee Payment Accounts

Permission	Action	Description	Feature
coupa_pay/employee_payment_accounts / bulk_loader	Bulk loader	Ability to bulk upload Employee Payment Accounts	Resolved issue in 44.6.0

Expense Payment Batches

Permission	Action	Description	Feature
coupa_pay/expenses/payment_batches / withdraw	Withdraw	Withdraw Payment Batch from Approvals	Withdraw Submitted Payment Batches

Expense Payments

Permission	Action	Description	Feature
coupa_pay/expenses/payments / remittance_information	Remittance Information	Edit remittance information for Release	Enhancements to Payment Instructions

External Payment Batches

Permission	Action	Description	Feature
coupa_pay/external/payment_batches / withdraw	Withdraw	Withdraw Payment Batch from Approvals	Withdraw Submitted Payment Batches

Invoice Payment Batches

Permission	Action	Description	Feature
coupa_pay/invoices/payment_batches / withdraw	Withdraw	Withdraw Payment Batch from Approvals	Withdraw Submitted Payment Batches

Invoice Payments

Permission	Action	Description	Feature
coupa_pay/invoices/payments / remittance_information	Remittance Information	Edit remittance information for Release	Enhancements to Payment Instructions

Invoices

Permission	Action	Description	Feature
invoices / bulk_download_attachments	Bulk Download Attachments	Bulk download invoice attachments and image scans	Resolved issue in 45.0.0
invoices / void_approved	Void Approved	Void an approved invoice	Resolved issue in 45.0.0
invoices / void_paid	Void Paid	Void a paid invoice	Resolved issue in 45.0.0

Items

Permission	Action	Description	Feature
items / edit_supplier_item	Edit supplier item	Allow edit of a supplier item	More Precise Control Over Item Ac-

Permission	Action	Description	Feature
			cess

Requisition Lines

Permission	Action	Description	Feature
requisition_lines / bulk_convert_item_to_service	Bulk convert item to service lines	Allows user to bulk convert Item lines to Service lines via CSV loader	Preserve Item-Amount Purchasing with Services Procurement

Supplier cXML Request Monitors

Permission	Action	Description	Feature
supplier_cxml_request_monitors / cxml_request_asn	cXML Request Advance Ship Notice	cXML request ASN view action	Supplier Visibility for ASN cXML Errors
supplier_cxml_request_monitors / cxml_request_order_confirmation	cXML Request Order Confirmation	cXML request order confirmation view action	Order Confirmation cXML Errors Visible on CSP
supplier_cxml_request_monitors / order_confirmation_show	Order Confirmation Show	Show order confirmation request	Order Confirmation cXML Errors Visible on CSP
supplier_cxml_request_monitors / asn_show	ASN Show	Show ASN request	Supplier Visibility for ASN cXML Errors
supplier_cxml_request_monitors /	Search Order Confirmation cXML Re-	Search order confirmation cXML re-	Order Confirmation cXML Errors Visible on CSP

Permission	Action	Description	Feature
search_order_confirmation_cxml_request_table	quest Table	quest	ble on CSP
supplier_cxml_request_monitors / search_asn_cxml_request_table	Search ASN cXML Request Table	Search ASN cXML request table	Supplier Visibility for ASN cXML Errors

Supplier Items

Permission	Action	Description	Feature
supplier_items / edit_supplier_item_contract	Edit supplier item contract	Allows users to update the contract of a supplier item	More Precise Control Over Item Access
supplier_items / edit_supplier_item_price	Edit supplier item price	Allows users to update the price of a supplier item	More Precise Control Over Item Access

Treasury Payment Batches

Permission	Action	Description	Feature
coupa_pay/treasury/payment_batches / withdraw	Withdraw	Withdraw Payment Batch from Approvals	Withdraw Submitted Payment Batches

Treasury Payments

Permission	Action	Description	Feature
coupa_pay/treasury/payments / remittance_information	Remittance Information	Edit remittance information for Release	Enhancements to Payment Instructions

Unmanaged Spend Opportunities

Permission	Action	Description	Feature
unmanaged_spend/opportunities / index	Index	Allow user to manage Unmanaged Spend Opportunities	Resolved issue in 44.5.0

User

These actions have been removed.

Permission	Action	Description	Feature
user / sort_supplier_data_submission_table	Sort Supplier Data Submission Table	Sort Supplier Business Profile Submissions in data table	Resolved issue in 45.0.0
user / sort_supplier_data_request_table	Sort Business Profile Requests Table	Sort Business Profile Requests table	Resolved issue in 45.0.0

Worker Assignments

Permission	Action	Description	Feature
worker_assign-	Add approver	Required to add	Worker Assignment

Permission	Action	Description	Feature
ments / add_ap-prover		approvers and watchers	Approvals
worker_assignments / approve	Approve	Required to approve	Worker Assignment Approvals
worker_assignments / bypass_approvals	Bypass approvals	Required to bypass all approvals	Worker Assignment Approvals
worker_assignments / bypass_current_approval	Bypass Current Approval	Required to bypass current approval	Worker Assignment Approvals
worker_assignments / change_request	Change Request	Allows user to request changes to worker assignments	Worker Assignment Approvals
worker_assignments / delete	Delete	Required to delete draft worker assignment	Worker Assignment Approvals
worker_assignments / reject	Reject	Required to reject	Worker Assignment Approvals
worker_assignments / remove_and_regenerate	Remove And Regenerate	Allows current approver to remove themselves and regenerate pending approvals	Worker Assignment Approvals
worker_assignments / remove_approval	Remove approval	Allows current Ultimate Approver to remove themselves	Worker Assignment Approvals

Permission	Action	Description	Feature
		and regenerate pending approvals	
worker_assignments / save_as_draft	Save As Draft	Required to save a draft worker assignment	Worker Assignment Approvals
worker_assignments / withdraw	Withdraw	Required to withdraw a worker assignment	Worker Assignment Approvals

Worker Compliance Form Responses

Permission	Action	Description	Feature
worker_compliance_form_responses / manually_assign	Manually Assign	Manually assign worker compliance form to a worker assignment	Resolved issue in 44.1.0

API-Specific Permissions

See the changes made to the permissions used for API keys in the May 2026 Release (R45).

The following list shows the added or removed API-specific permissions. It is organized by controller, showing each new action and the feature that introduced the new action.

NOTE:

These permissions can't be assigned to roles, and they are only available when creating an API key. Further, API keys have been replaced by OAuth. For more information, see [OAuth 2.0 and OIDC](#).

May 2026 Release (R45) API permission changes

AI Agent: Agent Status Sync

Added as part of a resolved issue in [44.5.0](#).

Permission	Action	Description
internal/api/agent_status_sync / update	Update	Can sync Navi agent status between Agent Studio and Core (scope core.navi_agent_list.write)

AI Agent: Internal API for Supplier Risk

Added as part of [Sanctions Risk Agent](#) and [Supplier Risk Profile Agent](#).

Permission	Action	Description
internal/api/supplier_risk / sanction_screen_list	Sanction Screen List	Get sanction screening results for a supplier name
internal/api/supplier_risk / search_suppliers	Search Suppliers	Search suppliers by name and address
internal/api/supplier_risk / supplier_risk_profile	Supplier Risk Profile	Get comprehensive risk profile for a supplier

API Charge Tax Codes

Added as part of future functionality.

Permission	Action	Description
api/charges/tax_codes / index	Index	Query tax codes in the charge update context

API Landed Cost Categories

Added as part of future functionality.

Permission	Action	Description
api/landed_cost/categories / index	Index	Query Landed Cost Categories
api/landed_cost/categories / create	Create	Create Landed Cost Category

Api/Contracts

Added as part of a resolved issue in [44.2.0](#).

Permission	Action	Description
api/contracts / check_out	Check-out	Check-out a legal document

Api/Coupa Pay/Card Authorizations

Added as part of [Coupa Card Real-Time Charges Improvements](#).

Permission	Action	Description
api/coupa_pay/card_authorizations / index	Index	Query Card Authorizations

Api/Coupa Pay/V2/Expenses/Payment Batches

Added as part of future functionality.

Permission	Action	Description
api/coupa_pay/v2/expenses/payment_batches / create	Create	Create expense payment batches by agent

Api/Coupa Pay/V2/Invoices/Payment Batches

Added as part of future functionality.

Permission	Action	Description
api/coupa_pay/v2/invoices/payment_batches / create	Create	Create invoice payment batches for agent

Unmanaged Spend

Added as part of a resolved issue in [44.5.0](#).

Permission	Action	Description
api/unmanaged_spend / index	Index	Get unmanaged spend

Unmanaged Spend Opportunities API

Added as part of a resolved issue in [44.5.0](#).

Permission	Action	Description
api/unmanaged_spend/opportunities / create	Create	Create Unmanaged Spend Opportunities via API
api/unmanaged_spend/opportunities / index	Index	Retrieve Unmanaged Spend Opportunities via API

Integration Updates

See the changes made to the API and CSV integrations in the May 2026 Release (R45).

Inbound API Changes

See the changes made to the Inbound API in the May 2026 Release (R45).

The following list shows the changes made to the API inbound formats across the Coupa platform. Unless otherwise stated, all elements are new. For more information, see [The Coupa Core API](#).

R45 updated inbound APIs

Charge

Element	Description	Req	Type	Feature
mer- chant_tax_ref_num	Merchant Tax Reference Number			Future func- tionality
charge_tax_lines	Tax Lines for charge			Future func- tionality

confirmation_status	Confirmation status		
created_by	User who created		

Element	Description	Req	Type
updated_by	User who updated		

CSV Import Changes

See the changes made to the CSV import in the May 2026 Release (R45).

The following list shows the changes made to the CSV imports across the Coupa platform. Unless otherwise stated, all columns are new.

NOTE:

If a column is labeled as hidden, it means that the column is available for use in the import, but it is not included in the template. To use hidden columns, you need to add them manually to the CSV file to be uploaded.

R45 updates imports

Account Type

Element	Description	Req	Type	Feature
Estimated Tax Required	Estimated Tax Required			Future functionality

Invoice Header

Element	Description	Req	Type	Feature
Line Product Tax Classification(cClasTrib)	Line Product Tax Classification (cClasTrib)			Support for Brazil tax reform
Line Tax Amount(vDevTrib)	Line Tax Amount Returned (vDevTrib)			Support for Brazil tax reform
Line Tax Amount(vCredPres)	Line Presumed Credit Amount (vCredPres)			Support for Brazil tax reform
Line Tax Amount Returned(vDif)	Line Tax Amount Deferred (vDif)			Support for Brazil tax reform

Supplier

Element	Description	Req	Type	Feature
Enable Single	Enable Single			Enable Single

Element	Description	Req	Type	Feature
Payment per Invoice	Payment per Invoice			Payment per Invoice

CSV Export Changes

See the changes made to the CSV export in the May 2026 Release (R45).

The following list shows the changes made to the CSV exports across the Coupa platform. Unless otherwise stated, all columns are new.

NOTE:

If a column is labeled as hidden, it means that the column doesn't appear in the export unless it is populated.

R45 updated exports

Contract Account Allocation

Added as part of [Split Billing on Contracts](#)

Element	Description	Req	Type
type	Describes the type of row. Value is 'Contract Split' for allocation rows.		
contract-id	The unique identifier Coupa assigns to the contract.		
contract-number	The contract number.		
contract-name	The contract name.		
account-allocation-id	The unique identifier Coupa assigns to the account allocation.		
account-allocation-sequence	The sequential counter Coupa assigns to the account allocation split.		
account-allocation-percent	The percentage of the total allocated to this split.		

Element	Description	Req	Type
account-code	The account code from Coupa. All segments are concatenated with a hyphen (-).		
account-active	A flag in Coupa to indicate if the account is active and can be selected. True or False.		
account-name	The account name from Coupa.		
billing-notes	A note to capture any information on this account allocation split.		
period-name	The accounting period name (if applicable).		
segment-1	Account segment within Coupa.		
segment-2	Account segment within Coupa.		
segment-3	Account segment within Coupa.		
segment-4	Account segment		

Element	Description	Req	Type
	within Coupa.		
segment-5	Account segment within Coupa.		
segment-6	Account segment within Coupa.		
segment-7	Account segment within Coupa.		
segment-8	Account segment within Coupa.		
segment-9	Account segment within Coupa.		
segment-10	Account segment within Coupa.		
segment-11	Account segment within Coupa.		
segment-12	Account segment within Coupa.		
segment-13	Account segment within Coupa.		
segment-14	Account segment within Coupa.		
segment-15	Account segment within Coupa.		
segment-16	Account segment		

Element	Description	Req	Type
	within Coupa.		
segment-17	Account segment within Coupa.		
segment-18	Account segment within Coupa.		
segment-19	Account segment within Coupa.		
segment-20	Account segment within Coupa.		

Order Line Component

Added as part of a future functionality.

Element	Description	Req	Type
record-type	Specifies the header format for the row.		
order-line-num	The Coupa Purchase Order Line Number.		
component-num	The component number within the order line.		
external-id	The external identifier for the component.		

Element	Description	Req	Type
name	The name of the component.		
description	The description of the component.		
quantity	The quantity of the component.		
uom-code	The unit of measure code for the component.		
item-number	The item number associated with the component.		
item-name	The item name associated with the component.		
notes	Notes for the component.		
component-type	The type of the component.		
confirmation-status	The confirmation status of the component.		
id	The Coupa internal ID for the component.		
order-line-id	The Coupa Pur-		

Element	Description	Req	Type
	chase Order Line ID.		
created-at	The timestamp when the component was created.		
updated-at	The timestamp when the component was last updated.		

Rate Card Line

Added as part of a future functionality.

Element	Description	Req	Type
record-type	RateCardLine		
order-header-id	PO Number / Coupa Internal ID		
order-line-id	Coupa Purchase Order Line ID		
order-line-num	Coupa Purchase Order Line Number		
active	Active		
name	Name		
code	Code		
type	Type		

Element	Description	Req	Type
price	Price		
unit-of-measure	Unit of Measure		
currency	Currency		
source	Source		
created-at	Created At		
updated-at	Updated At		

Reference Data :: Job Role :: Job Role Association

Added as part of a future functionality

Element	Description	Req	Type
record-type	JobRoleAssociation		
order-header-id	PO Number / Coupa Internal ID		
order-line-id	Coupa Purchase Order Line ID		
order-line-num	Coupa Purchase Order Line Number		
job-role-id	Job Role ID		
job-role-name	Job Role Name		
job-role-code	Job Role Code		
job-title-id	Job Title ID		

Element	Description	Req	Type
job-title-name	Job Title		
category	Category		
level	Level		
source	Source		
work-location-id	Work Location ID		
work-location	Work Location		
work-arrangement	Work Arrangement		
working-hours	Working Hours		
created-at	Created At		
updated-at	Updated At		

Schedule Line

Element	Description	Req	Type	Feature
external-id	External ID			Future func- tionality

Release Updates

See the changes in the May 2026 Release (R45).

May 2026 Release (R45) Resolved Issues

See the resolved issues and minor changes in the May 2026 Release (R45).

Coupa Core

Component	Description	Case Number
Coupa Navi	Resolved an issue that prevented the Navi chat window from displaying. Added the Coupa Navi - Access / Coupa Navi - Access (Navi Assistant / Navi Token) permission to the Coupa Navi User role. For more information, see Coupa Navi Setup . CD-569215, JZ-515564	--
Supplier	Resolved a permission issue that prevented individuals with the User system role from sorting data on the Business Profile Requests Activity table. CD-529188	
Virtual Cards	Resolved an issue which could prevent the API from accessing linked Financial Counterparties for virtual cards. CD-552523	--
Globalization	The French translation for	--

Component	Description	Case Number
	the English word "department" is updated from "Département" to "Service" to better match standard business terminology. Users with French locale settings must update their CSV templates to avoid file rejections. CD-574524
